## Abstract

We introduce a formal language for specifying dynamic updates for Software Defined Networks. Our language builds upon Network Kleene Algebra with Tests (NetKAT) and adds constructs for synchronisations and multi-packet behaviour to capture the interaction between the control- and data-plane in dynamic updates. We provide a sound and ground-complete axiomatization of our language. We exploit the equational theory to provide an efficient reasoning method about safety properties for dynamic networks. We implement our equational theory in DyNetiKAT – a tool prototype, based on the Maude Rewriting Logic and the NetKAT tool, and apply it to a case study. We show that we can analyse the case study for networks with hundreds of switches using our initial tool prototype.

## 1 Introduction

Software defined networking (SDN) has gained immense popularity due to simplicity in network management and offering network programmability. Many programming languages have been designed for programming SDNs [25, 15]. They range from industrial-scale, hardware-oriented and low-level programming languages such as OpenFlow [18] to domain-specific, high-level and programmer-centric languages such as Frenetic [10]. In recent years, there has been a growing interest in analysable languages based on mathematical foundations which provide a solid reasoning framework to prove correctness properties in SDNs (e.g., safety).

There is a spectrum of mathematically inspired network programming languages that varies between those with a small number of language constructs and those with expressive language design which allow them to support more networking features. On the more expressive side of the spectrum, Flowlog [20] is an example of a language that uses a powerful formalism (first-order Horn clause logic) to program a Software Defined Network (SDN). In order to keep the language decidable, Flowlog disallows recursion in the clauses. For the purpose of formal analysis of a Flowlog program, the authors of [20] provide a translator to the Alloy tool. As another example of an expressive language, Kinetic [14] is a language

based on finite state machines that is mostly geared towards dynamic feature of SDNs. Model checking is used to formally analyse the Kinetic programs. NetKAT [2, 9] is an example of a minimalist language based on Kleene algebra with tests that has a sound and complete equational theory. While the core of the language is very simple with a few number of operators, the language has been extended in various ways to support different aspects of networking such as congestion control [8], history-based routing [5] and higher-order functions [26].

Our starting point is NetKAT, because it provides a clean and analyseable framework for specifying SDNs. The minimalist design of NetKAT does not cater for some common (failure) patterns in SDNs, particularly those arising from dynamic reconfiguration and the interaction between the data- and control-plane flows. In [16], the authors have proposed an extension to NetKAT to support stateful network updates. The extension embraces the notion of mutable state in the language which is in contrast to its pure functional nature. The purpose of this paper is to propose an extension to NetKAT to support dynamic and stateful behaviours. To this end, we pledge to keep the minimalist design of NetKAT with adding only a few number of new operators. Furthermore, our extension does not contradict the nature of the language.

A number of concurrent extensions of NetKAT have been introduced to date [22, 27, 13]. These extensions followed different design decisions than the present paper and a comparison of their approaches with ours is provided in Section 2; however, the most important difference lies in the fact that inspired by earlier abstractions in this domain [21], we were committed to create different layers for data-plane flows and dynamic updates such that every data-plane packet observes a single set of flow tables through its flight through the network. This allowed us, unlike the earlier approaches, to build a layer on top of NetKAT without modifying its semantics.

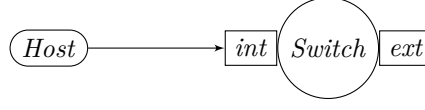

## 1.1 Running Examples

Throughout the paper, we focus on modelling with DyNetKAT two examples that involve dynamically updating the network configuration. In the first example, stateful firewall, the data-plane initiates the update by allowing a disallowed path in the network as a result of requests received from the trusted intranet. In the second, distributed controller, the control-plane initiates the update by modifying the forwarding route of a packet in a multi-controller setting.

► **Example 1.** A firewall is supposed to protect the intranet of an organization from unauthorised access from the Internet. However, due to certain requests from the intranet, it should be able to open up connections from the Internet to intranet. An example is when a user within the intranet requests a secure connection to a node on the Internet; in that case, the response from the node should be allowed to enter the intranet. The behaviour of updating the flow tables with respects to some events in the network such as receiving a specific packet is a challenging phenomenon for languages such as NetKAT.

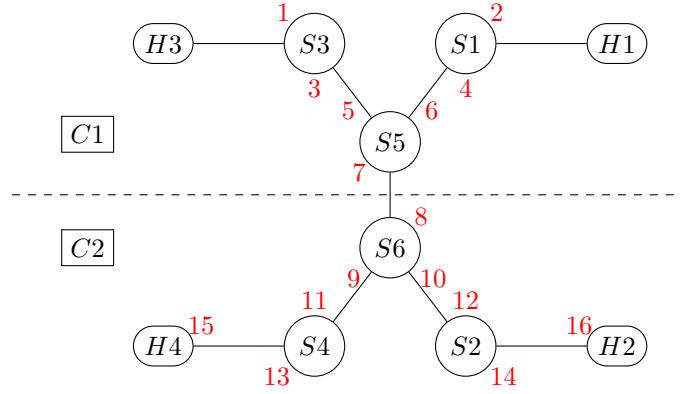

Figure 1 shows a simplified version of the stateful firewall network. In this version, the *Switch* does not allow any packet from the port *ext* to *int* at the beginning. When the *Host* sends a request to the *Switch* it opens up the connection.

► **Example 2.** Another running example concerns a well-known challenge in SDNs, namely, race conditions resulting from dynamic updates of flow-tables and in-flight packets [17, 24]. Below we specify a typical scenario for such race conditions; similar scenarios concerning actual bugs are abundant in the literature [24, 11, 12].

■ **Figure 1** Stateful Firewall

91 Consider the network topology depicted in Figure 2. The controller  $C1$  controls the top  
 92 part of the network (switches  $S1$ ,  $S3$  and  $S5$ ) and the controller  $C2$  is responsible for the  
 93 bottom part. Initially, the packets from  $H1$ , which enter the network through switch  $S1$   
 94 (port 2), should be routed through switches  $S5$  (through ports 6 and 7),  $S6$  (through ports  
 95 8 and 10) and finally port 12 of switch  $S2$ , to reach  $H2$ . Due to an event, the controllers  
 96 have to take down the previous route, and to install a new route in the network that routes  
 97 packets from  $H3$  through  $S3$  (ports 1 to 3),  $S5$  (through ports 5 to 7),  $S6$  (ports 8 to 9) to  
 98 switch  $S4$  (port 11) to finally reach  $H4$ . It is an important security property that the traffic  
 99 in these two routes should not mix. In particular, it will be serious breach if packets from  
 100  $H1$  arrive at  $H4$  or vice versa, packets from  $H3$  arrive at  $H2$ .

## 101 1.2 Our Contributions

- 102 The contributions of this paper are summarized as follows:
- 103 ■ we define the syntax and operational semantics of a dynamic extension of NetKAT that
  - 104 allows for modelling and reasoning about control-plane updates and their interaction
  - 105 with data-plane flows;
  - 106 ■ we give a sound and ground-complete axiomatization of our languages; and
  - 107 ■ we devise analysis methods for reasoning about flow properties using our axiomatization,
  - 108 apply them on examples from the domain and gather and analyze evidence of applicability
  - 109 and efficiency for our approach.

## 110 1.3 Structure of Paper

111 In Section 2, we provide a brief overview of NetKAT, review our design decision and  
 112 introduce the syntax and operational semantics of DyNetKAT. In Section 3, we investigate

some semantic properties of DyNetKAT by defining a notion of behavioural equivalence and providing a sound and ground-complete axiomatization. We exploit this axiomatization in Section 4 in an analysis method. We implement and apply our analysis method in Section 5 on a case study and report about its scalability on large examples with hundreds of switches. We conclude the paper and present some avenues for future work in Section 6.

## 2 Language Design

In what follows, we provide a brief overview of the NetKAT syntax and semantics [2]. Then, we motivate our language design decisions, we introduce the syntax of DyNetKAT and its underlying semantics, and provide the corresponding encoding of our running examples presented in Section 1.1.

### 2.1 Brief Overview of NetKAT

We proceed by first introducing some basic notions that are used throughout the paper.

► **Definition 1** (Network Packets.). *Let  $F = \{f_1, \dots, f_n\}$  be a set of field names  $f_i$  with  $i \in \{1, \dots, n\}$ . We call network packet a function in  $F \rightarrow \mathbb{N}$  that maps field names in  $F$  to values in  $\mathbb{N}$ . We use  $\sigma, \sigma'$  to range over network packets. We write, for instance,  $\sigma(f_i) = v_i$  to denote a test checking whether the value of  $f_i$  in  $\sigma$  is  $v_i$ . Furthermore, we write  $\sigma[f_i := n_i]$  to denote the assignment of  $f_i$  to  $v_i$  in  $\sigma$ .*

A (possibly empty) list of packets is formally defined as a function from natural numbers to packets, where the natural number in the domain denotes the position of the packet in the list such that the domain of the function forms an interval starting from 0.

The empty list is denoted by  $\langle \rangle$  and is formally defined as the empty function (the function with the empty set as its domain). Let  $\sigma$  be a packet and  $l$  be a list, then  $\sigma :: l$  is the list  $l'$  in which  $\sigma$  is at position 0 in  $l'$ , i.e.,  $l'(0) = \sigma$ , and  $l'(i+1) = l(i)$ , for all  $i$  in the domain of  $l$ .

In Figure 3, we recall the NetKAT syntax and semantics [2].

#### NetKAT Syntax:

$$\begin{aligned} Pr &::= \mathbf{0} \mid \mathbf{1} \mid Pr + Pr \mid Pr \cdot Pr \mid \neg Pr \\ N &::= Pr \mid f \leftarrow n \mid N + N \mid N \cdot N \mid N^* \mid \mathbf{dup} \end{aligned}$$

#### NetKAT Semantics:

$$\begin{aligned} \llbracket \mathbf{1} \rrbracket(h) &\triangleq \{h\} & \llbracket p \cdot q \rrbracket(h) &\triangleq (\llbracket p \rrbracket \bullet \llbracket q \rrbracket)(h) \\ \llbracket \mathbf{0} \rrbracket(h) &\triangleq \{\} & \llbracket p^* \rrbracket(h) &\triangleq \bigcup_{i \in \mathbb{N}} F^i(h) \\ \llbracket f = n \rrbracket(\sigma :: h) &\triangleq \begin{cases} \{\sigma :: h\} & \text{if } \sigma(f) = n \\ \{\} & \text{otherwise} \end{cases} & F^0(h) &\triangleq \{h\} \\ \llbracket \neg a \rrbracket(h) &\triangleq \{h\} \setminus \llbracket a \rrbracket(h) & F^{i+1}(h) &\triangleq (\llbracket p \rrbracket \bullet F^i)(h) \\ \llbracket f \leftarrow n \rrbracket(\sigma :: h) &\triangleq \{\sigma[f := n] :: h\} & (f \bullet g)(x) &\triangleq \bigcup \{g(y) \mid y \in f(x)\} \\ \llbracket p + q \rrbracket(h) &\triangleq \llbracket p \rrbracket(h) \cup \llbracket q \rrbracket(h) & \llbracket \mathbf{dup} \rrbracket(\sigma :: h) &\triangleq \{\sigma :: (\sigma :: h)\} \end{aligned}$$

■ **Figure 3** NetKAT: Syntax and Semantics [2]

The predicate for dropping a packet is denoted by  $\mathbf{0}$ , while passing on a packet (without any modification) is denoted by  $\mathbf{1}$ . The predicate checking whether the field  $f$  of a packet has value  $n$  is denoted by  $(f = n)$ ; if the predicate fails on the current packet it results on dropping the packet, otherwise it will pass the packet on. Disjunction and conjunction between predicates are denoted by  $Pr + Pr$  and  $Pr \cdot Pr$ , respectively. Negation is denoted

by  $\neg Pr$ . Predicates are the basic building blocks of NetKAT policies and hence, a predicate is a policy by definition. The policy that modifies the field  $f$  of the current packet to take value  $n$  is denoted by  $(f \leftarrow n)$ . A multicast behaviour of policies is denoted by  $N + N$ , while sequencing policies (to be applied on the same packet) are denoted by  $N \cdot N$ . The repeated application of a policy is encoded as  $N^*$ . The construct **dup** simply makes a copy of the current network packet.

In [2], lists of packets are referred to as *histories*. Let  $H$  stand for the set of packet histories, and  $\mathcal{P}(H)$  denote the powerset of  $H$ . More formally, the denotational semantics of NetKAT policies is inductively defined via the semantic map  $\llbracket - \rrbracket : N \rightarrow (H \rightarrow \mathcal{P}(H))$  in Figure 3, where  $N$  stands for the set of NetKAT policies,  $h \in H$  is a packet history,  $a \in Pr$  denotes a NetKAT predicate and  $\sigma \in F \rightarrow \mathbb{N}$  is a network packet.

For a reminder, the equational axioms of NetKAT, denoted by  $E_{NK}$ , are provided in Figure 4.  $E_{NK}$  includes the Kleene Algebra axioms (KA-...), Boolean Algebra axioms (BA-...) and Packet Algebra axioms (PA-...). The novelty is the set of PA-axioms. In short, PA-MOD-MOD-COMM states that the order in which two different packet fields are assigned does not matter. PA-MOD-FILTER-COMM encodes a similar property, for the case of a field assignment followed by a test of a different field's value. PA-MOD-FILTER ignores the test of a field preceded by an assignment of the same value to the field. Orthogonally, PA-FILTER-MOD ignores a field assignment preceded by a test against the assigned value. PA-MOD-MOD states that a sequence of assignments to the same field only takes into consideration the last assignment. PA-CONTRA encodes the fact that a field cannot have two different values at the same point. PA-MATCH-ALL identifies the policy accepting all the packets with the sum of all possible tests of a field's value. Intuitively, PA-DUP-FILTER-COMM states that adding the current packet to the history is independent of tests.

$p + (q + r) \equiv (p + q) + r$	KA-PLUS-ASSOC	$a + (b \cdot c) \equiv (a + b) \cdot (a + c)$	BA-PLUS-DIST

## 2.2 Design Decisions

Our main motivation behind DyNetKAT was to have a *minimalistic* language that can model *control-plane* and *data-plane* network traffic and their interaction. Our choice for a minimal language is motivated by our desire to use our language as a basis for scalable analysis. We would like to be able to compile major practical languages into ours. Our minimal design helps us reuse much of the well-known scalable analysis techniques. Regarding its modelling

capabilities, we are interested in modelling the stateful and dynamic behaviour of networks emerging from these interactions. We would like to be able to model control messages, connections between controllers and switches, data packets, links among switches, and model and analyse their interaction in a seamless manner.

Based on these motivations, we started off with NetKAT as a fundamental and minimal network programming language, which allows us to model the basic policies governing the network traffic. The choice of NetKAT, in addition to its minimalist nature, is motivated by its rigorous semantics and equational theory, and the existing techniques and tools for its analysis. This motivated our next design constraint, namely, to build upon NetKAT in a hierarchical manner and without redefining its semantics. This constraint should not be taken lightly as the challenges in the recent concurrent extensions of NetKAT demonstrated [22, 27, 13]. We will elaborate on this point, in the presentation of our syntax and semantics. We could achieve this thanks to the abstractions introduced in the domain [21] that allowed for a neat layering of data-plane and control-plan flows such that every data-plane flow sees one set of flow-tables in its flight through the network.

We then introduced few extensions and modifications to cater for the phenomena we desired to model in our extension regarding control-plane and dynamic and stateful behaviour:

- Synchronization: we introduced a basic mechanism of handshake synchronization with the possibility of communicating a network program (a flow table). This construct allows for capturing the dynamicity and interaction between the control and data planes.
- Guarded recursion: we introduced the concept of recursion to model the (persistent) dynamic changes that result from control messages and stateful behaviour; in other words, recursion is used to model the new state of the flow tables. An alternative modelling construct could have been using “global” variables and guards, but we preferred recursion due to its neat algebraic representation. We restricted the use of recursion to guarded recursion, that is a policy should be applied before changing state to a new recursive definition, in order to remain within a decidable and analyse-able realm. A natural extension of our framework could introduce formal parameters and parameterised recursive variables; this future extension is orthogonal to our existing extensions and in this paper, we go for a minimal extension in which the parameters are coded in variable names.
- Multi-packet semantics: we introduce the semantics of treating a list of packets, which is essential for studying the interaction between control- and data plane packets. This is in contrast with NetKAT where a single-packet semantics is introduced. The introduction of multi-packet semantics also called for a new operator to denote the end of applying a flow-table to the current packet and proceeding with the next packet (possibly with the modified flow-table in place). This is our new sequential composition operator, denoted by “;”.

## 2.3 DyNetKAT Syntax

As already mentioned, NetKAT provides the possibility of recording the individual “hops” that packets take as they go through the network by using the so-called **dup** construct. The latter keeps track of the state of the packet at each intermediate hop. As a brief reminder of the approach in [2]: assume a NetKAT switch policy  $p$  and a topology  $t$ , together with an ingress  $in$  and an egress  $out$ . Checking whether  $out$  is reachable from  $in$  reduces to checking:  $in \cdot \mathbf{dup} \cdot (p \cdot t \cdot \mathbf{dup})^* \cdot out \neq \mathbf{0}$  (see Definition 2 and Theorem 4 in [2]). Furthermore, as shown in [9], **dup** plays a crucial role in devising the NetKAT language semantics in a coalgebraic

219 fashion, via Brzowski-like derivatives on top of NetKAT coalgebras (or NetKAT automata)  
 220 corresponding to NetKAT expressions.

221 We decided to depart from NetKAT in this respect, due to our important constraint not  
 222 to redefine the NetKAT semantics: the **dup** expression allows for observable intermediate  
 223 steps that result from incomplete application of flow-tables and in concurrency scenarios, the  
 224 same data packet may become subject to more than one flow table due to the concurrent  
 225 interactions with the control plain. For this semantics to be compositional, one needs to  
 226 define a small step operational semantics in such a way that the small steps in predicate  
 227 evaluation also become visible (see our past work on compositionality of SOS with data on  
 228 such constraints [19]). This will first break our constrain in building upon NetKAT semantics  
 229 and secondly, due to the huge number of possible interleavings, make the resulting state-space  
 230 intractable for analysis.

231 In addition to the argumentation above, note that similarly to the approach in [2], we work  
 232 with packet fields ranging over finite domains. Consequently, our analyses can be formulated  
 233 in terms of reachability properties, further verifiable by means of **dup**-free expressions of  
 234 shape:  $in \cdot (p \cdot t)^* \cdot out \neq \mathbf{0}$ . Hence, we chose to define DyNetKAT synchronization, guarded  
 235 recursion and multi-packet semantics on top of the **dup**-free fragment of NetKAT, denoted  
 236 by  $\text{NetKAT}^{-\text{dup}}$ .

237 The syntax of DyNetKAT is defined on top of the **dup**-free fragment of NetKAT as:

$$\begin{aligned}
 N &::= \text{NetKAT}^{-\text{dup}} \\
 D &::= \perp \mid N ; D \mid x?N ; D \mid x!N ; D \mid D \parallel D \mid D \oplus D \mid X \\
 X &\triangleq D
 \end{aligned} \tag{1}$$

239 We sometimes write  $p \in \text{NetKAT}$ ,  $p \in \text{NetKAT}^{-\text{dup}}$  or, respectively,  $p \in \text{DyNetKAT}$  in  
 240 order to refer to a NetKAT,  $\text{NetKAT}^{-\text{dup}}$  or, respectively, DyNetKAT policy  $p$ .

241 The DyNetKAT-specific constructs are as follows. By  $\perp$  we denote a dummy policy  
 242 without behaviour. Our new sequential composition operator, denoted by  $N ; D$ , specifies  
 243 when the  $\text{NetKAT}^{-\text{dup}}$  policy  $N$  applicable to the current packet has come to a successful  
 244 end and, thus, the packet can be transmitted further and the next packet can be fetched for  
 245 processing according to the rest of the policy  $D$ .

246 Communication in DyNetKAT, encoded via  $x!N ; D$  and  $x?N ; D$ , consists of two steps. In  
 247 the first place, sending and receiving  $\text{NetKAT}^{-\text{dup}}$  policies through channel  $x$  are denoted by  
 248  $x!N$ , and  $x?N$ . Intuitively, these correspond to updating the current network configuration  
 249 according to  $N$ . Secondly, as soon as the sending or receiving messages are successfully com-  
 250 municated, a new packet is fetched and processed according to  $D$ . The parallel composition  
 251 of two DyNetKAT policies (to enable synchronization) is denoted by  $D \parallel D$ .

252 As it will become clearer in Section 2.4 (semantics), communication in DyNetKAT  
 253 guarantees preservation of well-defined behaviours when transitioning between network  
 254 configurations. This corresponds to the so-called per-packet consistency in [21], and it  
 255 guarantees that every packet traversing the network is processed according to exactly one  
 256  $\text{NetKAT}^{-\text{dup}}$  policy.

257 Non-deterministic choice of DyNetKAT policies is denoted by  $D \oplus D$ . For a non-  
 258 determinstic choice over a finite domain  $P$ , we use the syntactic sugar  $\oplus_{p \in P} P'$ , where  $p$   
 259 appears as “bound variable” in  $P'$ ; this is interpreted as a sum of finite summand by replacing  
 260 the variable  $p$  with all its possible values in  $P$ .

261 Finally, one can use recursive variables  $X$  in the specification of DyNetKAT policies,  
 262 where each recursive variable should have a unique defining equation  $X \triangleq D$ .

For the simplicity of notation, we do not explicitly specify the trailing “;  $\perp$ ” in our policy specifications, whenever clear from the context.

In Figure 5 we provide the DyNetKAT formalization of the firewall in Example 1. In the DyNetKAT encoding, we use the message channel *secConReq* to open up the connection and *secConEnd* to close it. We model the behavior of the switch using the two programs *Switch* and *Switch'*.

$$\begin{aligned}
Host &\triangleq secConReq!1; Host \oplus \\
&\quad secConEnd!1; Host \\
\\
Switch &\triangleq ((port = int) \cdot (port \leftarrow ext)); Switch \oplus \\
&\quad ((port = ext) \cdot \mathbf{0}); Switch \oplus \\
&\quad secConReq?1; Switch' \\
\\
Switch' &\triangleq ((port = int) \cdot (port \leftarrow ext)); Switch' \oplus \\
&\quad ((port = ext) \cdot (port \leftarrow int)); Switch' \oplus \\
&\quad secConEnd?1; Switch \\
\\
Init &\triangleq Host || Switch
\end{aligned}$$

■ **Figure 5** Stateful Firewall in DyNetKAT

In Figure 6 we provide the DyNetKAT formalization of the distributed controllers in Example 2. In the code in Figure 6 the controllers work independently to update the network (which can lead to security breach). The specification *SwitchX<sub>ft</sub>* is a generic specification for the behaviour of all switches in this example; the domain of *P* in this example is the set of all 5 policies that are being communicated, such as  $\mathbf{0}$ ,  $((port = 11) \cdot (port \leftarrow 13))$ , and  $((port = 5) \cdot (port \leftarrow 7))$ .

However, in the code in Figure 7 the controllers synchronise before updating the rest of the switches.

## 2.4 DyNetKAT Semantics

The operational semantics of DyNetKAT in Figure 8 is provided over configurations of shape  $(d, H, H')$ , where *d* stands for the current DyNetKAT policy, *H* is the list of packets to be processed by the network according to *d* and *H'* is the list of packets handled successfully by the network. The rule labels  $\gamma$  range over pairs of packets  $(\sigma, \sigma')$  or communication/reconfiguration-like actions of shape  $x!q$ ,  $x?q$  or **rcfg**(**x**, **q**), depending on the context.

Note that the DyNetKAT semantics is devised in a “layered” fashion. Rule (**cpol'**<sub>;</sub>) in Figure 8 is the base rule that makes the transition between the NetKAT denotations and DyNetKAT operations. More precisely, whenever  $\sigma'$  is a packet resulted from the successful evaluation of a NetKAT policy *p* on  $\sigma$ , a  $(\sigma, \sigma')$ -labelled step is observed at the level of DyNetKAT. This transition applies whenever the current configuration encapsulates a DyNetKAT policy of shape *p*; *q* and a list of packets to be processed starting with  $\sigma$ . The resulting configuration continues with evaluating *q* on the next packet in the list, while  $\sigma'$  is marked as successfully handled by the network.

$$\begin{aligned}
L &\triangleq (((port = 3) \cdot (port \leftarrow 5)) + \\
&\quad ((port = 4) \cdot (port \leftarrow 6)) + \\
&\quad ((port = 7) \cdot (port \leftarrow 8)) + \\
&\quad ((port = 9) \cdot (port \leftarrow 11)) + \\
&\quad ((port = 10) \cdot (port \leftarrow 12)) + \\
&\quad ((port = 13) \cdot (port \leftarrow 15)) + \\
&\quad ((port = 14) \cdot (port \leftarrow 16))) \\
\\
S_1 &\triangleq (port = 2) \cdot (port \leftarrow 4) \\
S_2 &\triangleq (port = 12) \cdot (port \leftarrow 14) \\
S_3 &\triangleq \mathbf{0} \\
S_4 &\triangleq \mathbf{0} \\
S_5 &\triangleq (port = 6) \cdot (port \leftarrow 7) \\
S_6 &\triangleq (port = 8) \cdot (port \leftarrow 10) \\
SDN_{X_1, \dots, X_6} &\triangleq ((X_1 + \dots + X_6) \cdot L)^* ; SDN_{X_1, \dots, X_6} \oplus \\
&\quad \sum_{X'_i \in FT} upSi?X'_i ; SDN_{X_1, \dots, X'_i, \dots, X_6} \\
\\
ft3 &\triangleq (port = 1) \cdot (port \leftarrow 3) \\
ft4 &\triangleq (port = 11) \cdot (port \leftarrow 13) \\
ft5 &\triangleq (port = 5) \cdot (port \leftarrow 7) \\
ft6 &\triangleq (port = 8) \cdot (port \leftarrow 9) \\

\end{aligned}$$

■ **Figure 7** Distributed Controller in DyNetKAT: Synchronizing Controllers

The remaining rules in Figure 8 define non-deterministic choice, synchronization and recursion in the standard fashion.

Rules  $(\mathbf{cpol}_{\oplus})$  and  $(\mathbf{cpol}_{\ominus})$  define non-deterministic behaviours. Assume  $H_0$  is the list of packets to be processed by the network according to  $p$  (respectively,  $q$ ) and  $H'_0$  is the list of packets handled successfully by the network. Whenever  $p$  (respectively,  $q$ ) determines a  $\gamma$ -labelled transition into  $(p', H_1, H'_1)$  (respectively,  $(q', H_1, H'_1)$ ), the policy  $p \oplus q$  is able to mimic the same behaviour. Rules  $(\mathbf{cpol}_{\parallel})$  and  $(\mathbf{cpol}_{\parallel\perp})$  follow a similar pattern; the only difference is that the “inactive” operand is preserved by the target of the semantic rule.

Mere sending  $(\mathbf{cpol}_!)$  and receiving  $(\mathbf{cpol}_?)$  entail transitions labelled accordingly, and continue with the DyNetKAT policy following the  $;$  operator. Note that the list of packets to be processed by the network and the list of packets handled successfully by the network remain unchanged.

DyNetKAT synchronization is defined by  $(\mathbf{cpol}_{!?})$  and  $(\mathbf{cpol}_{?!})$ . Intuitively, when both operands  $q$  and, respectively,  $s$  “agree” on sending/receiving a policy  $p$  on channel  $x$  in the context of the same packet lists  $H$  and  $H'$ , and behave like  $q'$ , respectively,  $s'$  afterwards, then a  $\mathbf{rcfg}(\mathbf{x}, \mathbf{p})$  step can be observed. The system proceeds with the continuation behaviour  $q' \parallel s'$ .

As denoted by  $(\mathbf{cpol}_{\mathbf{x}})$ , a recursive variable defined as  $X \triangleq p$  behaves according to  $p$ .

In Figure 9 we depict a labelled transition system (LTS) encoding a possible behaviour of the stateful firewall in Example 1. We assume the list of network packets to be processed consists of a “safe” packet  $\sigma_i$  travelling from *int* to *ext* (i.e.,  $\sigma_i(\text{port}) = \text{int}$ ) followed by a potentially “dangerous” packet  $\sigma_e$  travelling from *ext* to *int* (i.e.,  $\sigma_e(\text{port}) = \text{ext}$ ). For the simplicity of notation, in Figure 9 we write  $H$  for *Host*,  $S$  for *Switch*,  $S'$  for *Switch'*,  $SCR$  for *secConReq* and  $SCE$  for *secConEnd*. Note that  $\sigma_e$  can enter the network only if a secure connection request was received. More precisely, the transition labelled  $(\sigma_e, \sigma_i)$  is preceded by a transition labelled  $SCR?1$  or  $\mathbf{rcfg}(SCR, 1)$ :  $n_2 \xrightarrow{SCR?1, \mathbf{rcfg}(SCR, 1)} n_3 \xrightarrow{(\sigma_e, \sigma_i)} n_4$ .

In Figure 10 we depict an excerpt of the LTS corresponding to the distributed independent controllers in Example 2, given a network packet denoted by  $\sigma_2$ . In Figure 10 we write  $\sigma_i$  to denote a network packet such that  $\sigma_i(\text{port}) = i$ . For instance, transitions of shape  $n_0 \xrightarrow{(\sigma_2, \sigma_i)} \bar{n}_i$  encode forwarding of the current packet from port 2 to port  $i$  based on the subsequent unfoldings of the Kleene-star expression in the definition of  $SDN_{X_1, \dots, X_6}$ . The transition  $n_2 \xrightarrow{(\sigma_2, \sigma_{15})} \bar{n}_{15}$  reveals a breach in the network corresponding to the possibility of forwarding the current packet from  $H_1$  to  $H_4$ . This is possible due to two consecutive reconfigurations of the flow tables of switches  $S_6$  and  $S_4$ , respectively, enabling traffic from port 8 to 9, and from port 11 to 13.

### 3 Semantic Results

In this section we define bisimilarity of DyNetKAT policies, introduce some necessary definitions and terminology, and provide a corresponding sound and complete axiomatization.

#### 3.1 An Axiom System for DyNetKAT Bisimilarity

Bisimilarity of DyNetKAT terms is defined in the standard fashion:

► **Definition 2** (Bisimilarity  $(\sim)$ ). *A symmetric relation  $R$  over DyNetKAT policies is a bisimulation whenever for  $(p, q) \in R$  the following holds:*

*If  $(p, H_0, H_1) \xrightarrow{\gamma} (p', H'_0, H'_1)$  then exists  $q'$  s.t.  $(q, H_0, H_1) \xrightarrow{\gamma} (q', H'_0, H'_1)$  and  $(p', q') \in R$ , with  $\gamma ::= (\sigma, \sigma') \mid x?r \mid x!r \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{r})$ .*

$(\mathbf{cpol}_{-}^{\vee}) \frac{\sigma' \in \llbracket p \rrbracket(\sigma::\langle \rangle)}{(p; q, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (q, H, \sigma' :: H')}$	$(\mathbf{cpol}_{\mathbf{x}}) \frac{(p, H_0, H_1) \xrightarrow{\gamma} (p', H'_0, H'_1)}{(X, H_0, H_1) \xrightarrow{\gamma} (p', H'_0, H'_1)} X \triangleq p$
$(\mathbf{cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}$	$(\mathbf{cpol}_{\oplus-}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}$
$(\mathbf{cpol}_{-\parallel}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \parallel q, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel q, H_1, H'_1)}$	$(\mathbf{cpol}_{\parallel-}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \parallel q, H_0, H'_0) \xrightarrow{\gamma} (p \parallel q', H_1, H'_1)}$
$(\mathbf{cpol}_{?}) \frac{}{(x?p; q, H, H') \xrightarrow{x?p} (q, H, H')}$	$(\mathbf{cpol}_{!}) \frac{}{(x!p; q, H, H') \xrightarrow{x!p} (q, H, H')}$
$(\mathbf{cpol}_{!?}) \frac{(q, H, H') \xrightarrow{x!p} (q', H, H') \quad (s, H, H') \xrightarrow{x?p} (s', H, H')}{(q \parallel s, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{p})} (q' \parallel s', H, H')}$	
$(\mathbf{cpol}_{?!}) \frac{(q, H, H') \xrightarrow{x?p} (q', H, H') \quad (s, H, H') \xrightarrow{x!p} (s', H, H')}{(q \parallel s, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{p})} (q' \parallel s', H, H')}$	

$$\gamma ::= (\sigma, \sigma') \mid x!q \mid x?p \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{q})$$

■ **Figure 8** DyNetKAT: Operational Semantics

336 We call bisimilarity the largest bisimulation relation.

337 Two policies  $p$  and  $q$  are bisimilar ( $p \sim q$ ) if and only if there is a bisimulation relation  
338  $R$  such that  $(p, q) \in R$ .

339 Semantic equivalence of  $\text{NetKAT}^{-\text{dup}}$  policies is preserved by DyNetKAT bisimilarity.

340 ► **Proposition 3** (Semantic Layering). *Let  $p$  and  $q$  be two  $\text{NetKAT}^{-\text{dup}}$  policies. The following*  
341 *holds:*

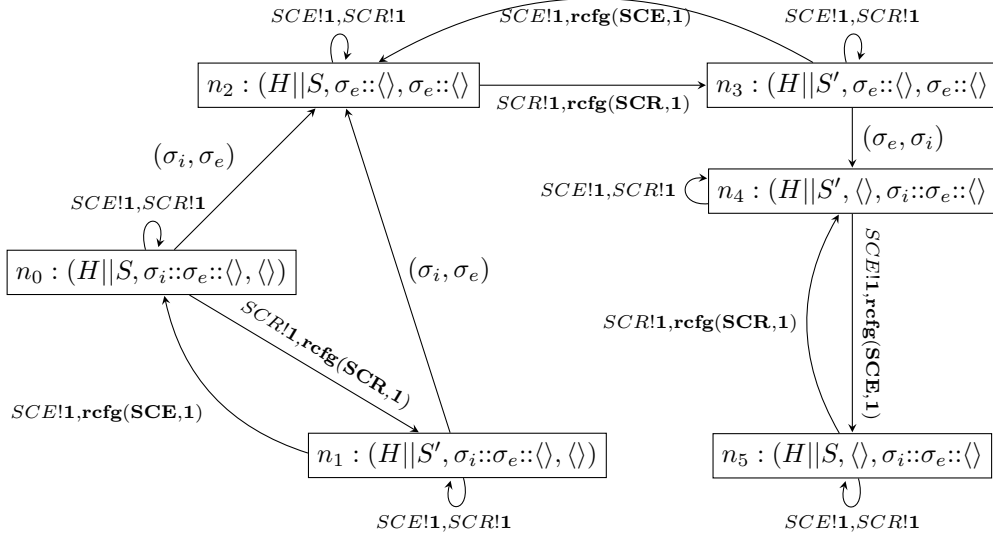

342  $\llbracket p \rrbracket = \llbracket q \rrbracket$  iff  $(p; d) \sim (q; d)$

343 for any DyNetKAT policy  $d$ .

344 **Proof.** The result follows directly according to the definition of bisimilarity and  $(\mathbf{cpol}_{-}^{\vee})$  in  
345 Figure 8. ◀

346 Next, we introduce the restriction operator  $\delta_{\mathcal{L}}(-)$  [1, 3], with  $\mathcal{L}$  a set of forbidden actions  
347 ranging over  $x?z$  and  $x!z$  as in (1). The semantics of  $\delta_{\mathcal{L}}(-)$  is:

$$348 \quad (\delta) \frac{(p, H_0, H_1) \xrightarrow{\gamma} (p', H'_0, H'_1)}{(\delta_{\mathcal{L}}(p), H_0, H_1) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(p'), H'_0, H'_1)} \gamma \notin \mathcal{L} \quad (2)$$

■ **Figure 9** Stateful Firewall LTS

In practice, we use the restriction operator to force synchronous communication. For an example, consider the synchronising controllers in Figure 7. Let  $\mathcal{L}$  be the set of restricted actions ranging over elements of shape  $upS_i!X$ ,  $upS_i!X$ ,  $syn?1$  and  $syn!1$ . The restricted system  $\delta_{\mathcal{L}}(SDN_{S_1, \dots, S_6} || C_1 || C_2)$  ensures that: (1) traffic through  $S_2$  and  $S_1$  is first disabled via reconfigurations  $\mathbf{rcfg}(\mathbf{upS}_2, \mathbf{0})$  and  $\mathbf{rcfg}(\mathbf{upS}_1, \mathbf{0})$  and (2) the controllers acknowledge this deactivation via a synchronization step  $\mathbf{rcfg}(\mathbf{syn}, \mathbf{1})$  before installing further flow tables for  $S_4$  and  $S_6$ .

In the style of [3], we define a projection operator  $\pi_n(-)$  that, intuitively, captures the first  $n$  steps of a DyNetKAT policy. Its formal semantics is:

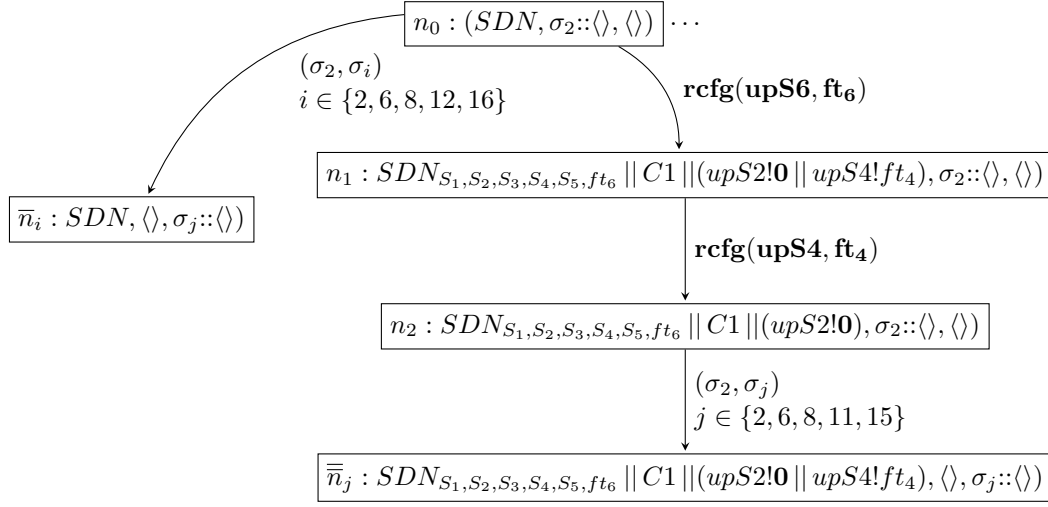

$$(\pi) \frac{(p, H_0, H_1) \xrightarrow{\gamma} (p', H'_0, H'_1)}{(\pi_{n+1}(p), H_0, H_1) \xrightarrow{\gamma} (\pi_n(p'), H'_0, H'_1)} \quad (3)$$

As we shall later see,  $\pi_n(-)$  is crucial for defining the so-called “Approximation Induction Principle” that enables reasoning about equivalence of recursive DyNetKAT specifications.

We further provide some additional ingredients needed to introduce the DyNetKAT axiomatization in Figure 11. First, note that our notion of bisimilarity identifies synchronization steps as in  $(\mathbf{cpol}!?)$  and  $(\mathbf{cpol}?!)$ . At the axiomatization level, this requires introducing corresponding constants  $\mathbf{rcfg}_{x,z}$  defined as:

$$(\mathbf{rcfg}_{x,z}) \frac{}{(\mathbf{rcfg}_{x,z}; p, H_0, H_1) \xrightarrow{\mathbf{rcfg}(x,z)} (p, H_0, H_1)} \quad (4)$$

Last, but not least, we introduce the left-merge operator  $(\parallel)$  and the communication-merge operator  $(\mid)$  utilised for axiomatizing parallel composition. Intuitively, a process of shape  $p \parallel q$  behaves like  $p$  as a first step, and then continues as the parallel composition between the remaining behaviour of  $p$  and  $q$ . A process of shape  $p \mid q$  forces the synchronous communication between  $p$  and  $q$  in a first step, and then continues as the parallel composition

■ **Figure 10** Independent Controllers LTS (excerpt)

371 between the remaining behaviours of  $p$  and  $q$ . The corresponding semantic rules are:

$$\begin{aligned}
 & (\parallel) \frac{(p, H_0, H_1) \xrightarrow{\gamma} (p', H'_0, H'_1)}{(p \parallel q, H_0, H_1) \xrightarrow{\gamma} (p' \parallel q, H'_0, H'_1)} \quad \gamma ::= (\sigma, \sigma') \mid x!p \mid x?p \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{p}) \\
 & (|?) \frac{(p, H, H') \xrightarrow{x?r} (p', H, H') \quad (q, H, H') \xrightarrow{x!r} (q', H, H')}{(p \mid q, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{p})} (p' \parallel q', H, H')} \\
 & (|!) \frac{(p, H, H') \xrightarrow{x!r} (p', H, H') \quad (q, H, H') \xrightarrow{x?r} (q', H, H')}{(p \mid q, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{p})} (p' \parallel q', H, H')}
 \end{aligned} \tag{5}$$

373 From this point onward, we denote by DyNetKAT the extension with the operators in (2),  
 374 (3) and (4):

$$\begin{aligned}
 N & ::= \text{NetKAT}^{\text{-dup}} \\
 D_e & ::= \perp \mid N \mid D \mid x?N \mid D_e \mid x!N \mid D_e \mid \mathbf{rcfg}_{x,N} \mid D_e \mid \\
 & \quad D_e \parallel D_e \mid D_e \oplus D_e \mid \delta_{\mathcal{L}}(D_e) \mid \pi_n(D_e) \mid D_e \parallel D_e \mid D_e | D_e \mid X \\
 & \quad X \triangleq D_e, n \in \mathbb{N}, \mathcal{L} = \{c \mid c ::= x?N \mid x!N\}
 \end{aligned} \tag{6}$$

376 Bisimilarity is defined for DyNetKAT terms as in (6) in the natural fashion, according to the  
 377 operational semantics of the new operators in (2), (3) and (4).

378 ► **Lemma 3.** DyNetKAT *bisimilarity* is a congruence.

379 **Proof.** The result follows from the fact that the semantic rules defined in this paper comply  
 380 to the congruence formats proposed in [19]. ◀

381 ► **Definition 4** (Complete Tests & Assignments [2]). Let  $F = \{f_1, \dots, f_n\}$  be a set of fields  
 382 names with values in  $V_i$ , for  $i \in \{1, \dots, n\}$ . We call complete test (typically denoted by  
 383  $\alpha$ ) an expression  $f_1 = v_1 \dots f_n = v_n$ , with  $v_i \in V_i$ , for  $i \in \{1, \dots, n\}$ . We call complete  
 384 assignment (typically denoted by  $\pi$ ) an expression  $f_1 \leftarrow v_1 \dots f_n \leftarrow v_n$ , with  $v_i \in V_i$ , for  
 385  $i \in \{1, \dots, n\}$ . We sometimes write  $\alpha_\pi$  in order to denote the complete test derived from

for $p, q, r \in \text{DyNetKAT}$ and $z, y \in \text{NetKAT}^{-\text{dup}}$		for $at ::= \alpha \cdot \pi \mid x?z \mid x!z \mid \mathbf{rcfg}_{x,z}$ :	
for $a ::= z \mid x?z \mid x!z \mid \mathbf{rcfg}_{x,z}$			
$\mathbf{0}; p \equiv \perp$	(A0)	$\delta_{\mathcal{L}}(\perp) \equiv \perp$	( $\delta_{\perp}$ )
$(z + y); p \equiv z; p \oplus y; p$	(A1)	$\delta_{\mathcal{L}}(at; p) \equiv at; \delta_{\mathcal{L}}(p)$ if $at \notin \mathcal{L}$	( $\delta_{\cdot}$ )
$p \oplus q \equiv q \oplus p$	(A2)	$\delta_{\mathcal{L}}(at; p) \equiv \perp$ if $at \in \mathcal{L}$	( $\delta_{\cdot}^{\perp}$ )
$(p \oplus q) \oplus r \equiv p \oplus (q \oplus r)$	(A3)	$\delta_{\mathcal{L}}(p \oplus q) \equiv \delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q)$	( $\delta_{\oplus}$ )
$p \oplus p \equiv p$	(A4)		
$p \oplus \perp \equiv p$	(A5)	for $n \in \mathbb{N}$ :	
$p \parallel q \equiv q \parallel p$	(A6)	$\pi_0(p) \equiv \perp$	( $\Pi_0$ )
$p \parallel \perp \equiv p$	(A7)	$\pi_n(\perp) \equiv \perp$	( $\Pi_{\perp}$ )
$p \parallel q \equiv p \parallel q \oplus q \parallel p \oplus p \parallel q$	(A8)	$\pi_{n+1}(at; p) \equiv at; \pi_n(p)$	( $\Pi_{\cdot}$ )
$\perp \parallel p \equiv \perp$	(A9)	$\pi_n(p \oplus q) \equiv \pi_n(p) \oplus \pi_n(q)$	( $\Pi_{\oplus}$ )
$(a; p) \parallel q \equiv a; (p \parallel q)$	(A10)		
$(p \oplus q) \parallel r \equiv (p \parallel r) \oplus (q \parallel r)$	(A11)	$p \equiv q$ if $\forall n \in \mathbb{N} : \pi_n(p) \equiv \pi_n(q)$	(AIP)
$(x?z; p) \mid (x!z; q) \equiv \mathbf{rcfg}_{x,z}; (p \parallel q)$	(A12)		
$(p \oplus q) \mid r \equiv (p \mid r) \oplus (q \mid r)$	(A13)	$E_{NK}$	
$p \mid q \equiv q \mid p$	(A14)		
$p \mid q \equiv \perp$ [otherwise]	(A15)		

■ **Figure 11** The axiom system  $E_{DNK}$  (including  $E_{NK}$ )

386 the complete assignment  $\pi$  by replacing all  $f_i \leftarrow v_i$  in  $\pi$  with  $f_i = v_i$ ; symmetrically for  $\pi_{\alpha}$ .  
 387 Additionally, we sometimes write  $\sigma_{\alpha}$  to denote the network packet whose fields are assigned  
 388 the corresponding values in  $\alpha$ ; symmetrically for  $\sigma_{\pi}$ .

389 In Figure 11, we introduce  $E_{DNK}$  – the axiom system of DyNetKAT, including the  
 390 NetKAT axiomatization  $E_{NK}$ . Most of the axioms in Figure 11 comply to the standard  
 391 axioms of parallel and communicating processes [3], where, intuitively,  $\oplus$  plays the role  
 392 of non-deterministic choice,  $;$  resembles sequential composition and  $\perp$  is a process that  
 393 deadlocks.

394 For instance, axioms (A2) – (A5) encode the ACI properties of  $\oplus$  together with the fact  
 395 that  $\perp$  is the neutral element.

396 Axioms (A8) – (A15) define parallel composition ( $\parallel$ ) in terms of left-merge ( $\parallel$ ) and  
 397 communication-merge ( $\mid$ ) in the standard fashion. Additionally, (A12) “pin-points” a  
 398 communication step via the newly introduced constants of form  $\mathbf{rcfg}_{x,z}$ . An interesting  
 399 axiom is (A7) :  $p \parallel \perp \equiv p$  which, intuitively, states that if one network component fails,  
 400 then the whole system continues with the behaviour of the remaining components. This is a  
 401 departure from the approach in [13], where recovery is not possible in case of a component’s  
 402 failure; i.e.,  $e \parallel 0 \equiv 0$ .

403 Axiom (A0) states that if the current packet is dropped as a result of the unsuccessful  
 404 evaluation of a NetKAT policy, then the continuation is deadlocked. (A1) enables mapping  
 405 the non-deterministic choice at the level of NetKAT to the setting of DyNetKAT.

406 The axioms encoding the restriction operator  $\delta_{\mathcal{L}}(-)$  and the projection operator  $\pi_n(-)$   
 407 are defined in the standard fashion, on top of DyNetKAT normal forms later defined in  
 408 this section. Intuitively, normal forms are defined inductively, as sums of complete tests  
 409 and complete assignments  $\alpha \cdot \pi$ , or communication steps  $x?q$ ,  $x!q$  and  $\mathbf{rcfg}_{x,q}$ , followed by  
 410 arbitrary DyNetKAT policies.

411 Last, but not least, (AIP) corresponds to the so-called “Approximation Induction  
 412 Principle”, and it provides a mechanism for reasoning on the equivalence of recursive  
 413 behaviours, up to a certain limit denoted by  $n$ .

### 3.1.1 Soundness and Completeness

In what follows, we show that the axiom system  $E_{DNK}$  is sound and ground-complete with respect to DyNetKAT bisimilarity.

We proceed by first defining a notion of normal forms of DyNetKAT terms, together with a notion of guardedness and a statement about the branching finiteness of guarded DyNetKAT processes.

► **Lemma 5** (NetKAT<sup>-dup</sup> Normal Forms). *We call a NetKAT<sup>-dup</sup> policy  $q$  in normal form (n.f.) whenever  $q$  is of shape  $\Sigma_{\alpha \cdot \pi \in \mathcal{A}} \alpha \cdot \pi$  with  $\mathcal{A} = \{\alpha_i \cdot \pi_i \mid i \in I\}$ . For every NetKAT<sup>-dup</sup> policy  $p$  there exists a NetKAT<sup>-dup</sup> policy  $q$  in n.f. such that  $E_{NK} \vdash p \equiv q$ .*

**Proof.** The result follows by Lemma 4 in [2], stating that:

$$\llbracket p \rrbracket = \bigcup_{x \in G(p)} \llbracket x \rrbracket \quad (7)$$

where  $G(p)$  defines the language model of NetKAT terms. Let  $A$  be the set of all complete tests, and  $\Pi$  be the set of all complete assignments. Similarly to [2], we consider network packets with values in finite domains. Consequently,  $A$  and  $\Pi$  are finite. In [2],  $G(p)$  is defined as a set with elements in  $A \cdot (\Pi \cdot \mathbf{dup})^* \cdot \Pi$ . Recall that, in our setting, we work with the **dup**-free fragment of NetKAT. Hence,  $G(p)$  is a finite set of shape  $G = \{\alpha_i \cdot \pi_i \mid i \in I, \alpha_i \in A, \pi_i \in \Pi\}$ . Based on the definition of  $\llbracket - \rrbracket$  and (7) it follows that:

$$\llbracket p \rrbracket = \llbracket \Sigma_{\alpha \cdot \pi \in G} \alpha \cdot \pi \rrbracket \quad (8)$$

Therefore, by the completeness of NetKAT, it holds that:  $E_{NK} \vdash p \equiv \Sigma_{\alpha \cdot \pi \in G} \alpha \cdot \pi$ . In other words,  $p$  can be reduced to a term in n.f. ◀

► **Definition 6** (DyNetKAT Normal Forms). *We call a DyNetKAT policy in normal form (n.f.) if it is of shape*

$$\Sigma_{i \in I}^{\oplus} (\alpha_i \cdot \pi_i); d_i \oplus \Sigma_{j \in J}^{\oplus} c_j; d_j (\oplus \perp)$$

where  $d_i, d_j$  range over DyNetKAT policies and  $c_j ::= x?q \mid x!q \mid \mathbf{rcfg}_{x,q}$  with  $q$  denoting terms in NetKAT<sup>-dup</sup>.

► **Definition 7** (Guardedness). *A DyNetKAT policy  $p$  is guarded if and only if all occurrences of all variables  $X$  in  $p$  are guarded. An occurrence of a variable  $X$  in a policy  $p$  is guarded if and only if (i)  $p$  has a subterm of shape  $p'; t$  such that either  $p'$  is variable-free, or all the occurrences of variables  $Y$  in  $p'$  are guarded, and  $X$  occurs in  $t$ , or (ii) if  $p$  is of shape  $y?X; t$ ,  $y!X; t$  or  $\mathbf{rcfg}_{X,t}$ .*

► **Lemma 8** (Branching Finiteness). *All guarded DyNetKAT policies are finitely branching.*

► **Lemma 9** (DyNetKAT Normalization).  *$E_{DNK}$  is normalising for DyNetKAT. In other words, for every guarded DyNetKAT policy  $p$  there exists a DyNetKAT policy  $q$  in n.f. such that  $E_{DNK} \vdash p \equiv q$ .*

**Proof.** The proof follows from Lemma 5 and (A1) :  $(z + y); p \equiv z; p \oplus y; p$  in a standard fashion, by structural induction.

*Base cases.*

■  $p \triangleq \perp$  trivially holds

- 452 ■  $p \triangleq q; d$  with  $q$  a  $\text{NetKAT}^{\text{dup}}$  term holds by Lemma 5 and (A1)
- 453 ■  $p \triangleq c; d$  with  $c ::= x?q \mid x!q \mid \mathbf{rcfg}_{x,q}$  trivially holds

454 *Induction step.*

- 455 ■  $p \triangleq p_1 \oplus p_2$   $p \triangleq X$  - case discarded, as  $p$  is not guarded
- 456 ■  $p \triangleq p_1 \parallel p_2$   $p \triangleq \pi_n(')$
- 457 ■  $p \triangleq p_1 \mid p_2$   $p \triangleq \delta_{\mathcal{L}}(p')$
- 458 ■  $p \triangleq p_1 \parallel p_2$

459 All items above follow by the axiom system  $E_{DNK}$  and the induction hypothesis, under the  
 460 assumption that  $p_1, p_2$  and  $p'$  are guarded. ◀

461 For simplicity, in what follows, we assume that DyNetKAT policies are guarded.

462 ► **Lemma 10** (Soundness of  $E_{\text{DyNetKAT} \setminus \text{AIP}}$ ). *Let  $E_{\text{DyNetKAT} \setminus \text{AIP}}$  stand for the axiom system*  
 463  *$E_{DNK}$  in Figure 11, without the axiom (AIP).  $E_{\text{DyNetKAT} \setminus \text{AIP}}$  is sound for DyNetKAT*  
 464 *bisimilarity.*

465 **Proof.** The proof reduces to showing that for all  $p, q$  DyNetKAT policies, the following  
 466 holds: If  $E_{\text{DyNetKAT} \setminus \text{AIP}} \vdash p \equiv q$  then  $p \sim q$ . This is proven in a standard fashion, by case  
 467 analysis on transitions of shape

$$468 \quad (p, H_0, H'_0) \xrightarrow{\gamma} (q, H_1, H'_1)$$

469 with  $\gamma ::= (\sigma, \sigma') \mid x?n \mid x!n \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{n})$ , according to the semantic rules in Figure 8, (2),  
 470 (3), (4) and (5).

471 For an example, consider (A1) and (A12) in Figure 11; the proof of soundness for these  
 472 axioms are given in the following. The soundness proofs for the rest of the axioms are  
 473 provided in Appendix A.

474 ■ Axiom under consideration:

$$475 \quad (z + y); p \equiv z; p \oplus y; p \quad (\text{A1}) \tag{9}$$

476 for  $z, y \in \text{NetKAT}^{\text{dup}}$  and  $p \in \text{DyNetKAT}$ . Consider an arbitrary but fixed network  
 477 packet  $\sigma$ , let  $S_z \triangleq \llbracket z \rrbracket(\sigma::\langle \rangle)$ ,  $S_y \triangleq \llbracket y \rrbracket(\sigma::\langle \rangle)$  and  $S_{zy} \triangleq \llbracket z + y \rrbracket(\sigma::\langle \rangle)$ . According to the  
 478 semantic rules of DyNetKAT, the derivations of the term  $(z + y); p$  are as follows:

(a)

$$479 \quad \text{For all } \sigma' \in S_{zy} : \quad (\mathbf{cpol}_{-}^{\vee}) \frac{}{((z + y); p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')}$$

480 Accordingly, the derivations of the term  $z; p \oplus y; p$  are as follows:

(b)

$$481 \quad \begin{array}{c} \text{For all } \sigma' \in S_z : \quad (\mathbf{cpol}_{-}^{\vee}) \frac{}{(z; p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')} \\ (\mathbf{cpol}_{\oplus}) \frac{}{(z; p \oplus y; p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')} \end{array}$$

(c)

$$482 \quad \begin{array}{c} \text{For all } \sigma' \in S_y : \quad (\mathbf{cpol}_{-}^{\vee}) \frac{}{(y; p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')} \\ (\mathbf{cpol}_{\oplus}) \frac{}{(z; p \oplus y; p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')} \end{array}$$

As demonstrated in (a) and (b), (c), both of the terms  $(z + y); p$  and  $z; p \oplus y; p$  initially only afford a transition of shape  $(\sigma, \sigma')$  and they converge into the same expression after taking that transition:

$$((z + y); p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H') \quad (10)$$

$$(z; p \oplus y; p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H') \quad (11)$$

In the case of the term  $(z + y); p$ , the possible values for the  $\sigma'$  ranges over  $S_{zy}$ . Whereas for the term  $z; p$ , the possible values for the  $\sigma'$  ranges over  $S_z \cup S_y$ . However, observe that  $S_{zy}$  is equal to  $S_z \cup S_y$ :

$$S_{zy} = \llbracket z + y \rrbracket(\sigma :: \langle \rangle) \quad (\text{Definition of } S_{zy}) \quad (12)$$

$$= \llbracket z \rrbracket(\sigma :: \langle \rangle) \cup \llbracket y \rrbracket(\sigma :: \langle \rangle) \quad (\text{Definition of } +) \quad (13)$$

$$= S_z \cup S_y \quad (\text{Definition of } S_z \text{ and } S_y) \quad (14)$$

Hence, it is straightforward to conclude that the following holds:

$$((z + y); p) \sim (z; p \oplus y; p) \quad (15)$$

■ Axiom under consideration:

$$(x?z; p) \mid (x!z; q) \equiv \mathbf{rcfg}_{x,z}; (p \parallel q) \quad (A12) \quad (16)$$

for  $p, q \in \text{DyNetKAT}$ . The derivations of the term  $(x?z; p) \mid (x!z; q)$  are as follows:

(a)

$$\frac{\frac{(\mathbf{cpol}_?) \overline{(x?z; p, H, H') \xrightarrow{x?z} (p, H, H')}}{(|?) \overline{(x?z; p) \mid (x!z; q), H, H'}} \quad \frac{(\mathbf{cpol}_!) \overline{(x!z; q, H, H') \xrightarrow{x!z} (q, H, H')}}{(\mathbf{rcfg}(\mathbf{x}, \mathbf{z})) \overline{(p \parallel q, H, H')}}}{((x?z; p) \mid (x!z; q), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p \parallel q, H, H')}$$

The derivations of the term  $\mathbf{rcfg}_{x,z}; (p \parallel q)$  are as follows:

(b)

$$\frac{(\mathbf{rcfg}_{\mathbf{x}, \mathbf{z}}) \overline{(\mathbf{rcfg}_{x,z}; (p \parallel q), H, H')}}{(\mathbf{rcfg}_{x,z}; (p \parallel q), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p \parallel q, H, H')}$$

As demonstrated in (a) and (b), both of the terms  $(x?z; p) \mid (x!z; q)$  and  $\mathbf{rcfg}_{x,z}; (p \parallel q)$  initially only afford the transition  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  and they converge into the same expression after taking that transition:

$$((x?z; p) \mid (x!z; q), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p \parallel q, H, H') \quad (17)$$

$$(\mathbf{rcfg}_{x,z}; (p \parallel q), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p \parallel q, H, H') \quad (18)$$

Hence, it is straightforward to conclude that the following holds:

$$((x?z; p) \mid (x!z; q)) \sim (\mathbf{rcfg}_{x,z}; (p \parallel q)). \quad (19)$$

► **Lemma 11** (Soundness of AIP). *The Approximation Induction Principle (AIP) is sound for DyNetKAT bisimilarity.*

**Proof.** The proof is close to the one of Theorem 2.5.8 in [3] and uses the branching finiteness property of DyNetKAT policies in Lemma 8. Assume two DyNetKAT policies  $p, p'$  such that

$$\forall n \in \mathbb{N} : \pi_n(p) \equiv \pi_n(p') \quad (20)$$

By Lemma 10 it follows that

$$\forall n \in \mathbb{N} : \pi_n(p) \sim \pi_n(p') \quad (21)$$

We want to prove that  $p \sim p'$ . The idea is to build a bisimulation relation  $R$  such that  $(p, p') \in R$ . We define  $R$  as follows:

$$R = \{(t, t') \mid \forall n \in \mathbb{N} : \pi_n(t) \sim \pi_n(t')\} \quad (22)$$

Without loss of generality, assume that  $p$  and  $p'$  are in n.f. Assume  $(p, p') \in R$  and

$$(p, H_0, H'_0) \xrightarrow{\gamma} (p_1, H_1, H'_1) \quad (23)$$

Next, for all  $n > 0$ , define

$$S_n = \{p'_1 \mid (p', H_0, H'_0) \xrightarrow{\gamma} (p'_1, H_1, H'_1) \text{ and } \pi_n(p_1) \sim \pi_n(p'_1)\} \quad (24)$$

The following hold:

1.  $S_1 \supseteq S_2 \dots$  as if  $\pi_{n+1}(p) \sim \pi_{n+1}(p')$  then  $\pi_n(p_1) \sim \pi_n(p'_1)$ . The latter is a straightforward result derived according to the definition of  $\sim$  and the semantics of  $\pi_n(-)$ , under the assumption that  $p, p'$  are in n.f.
2.  $S_n \neq \emptyset$  for all  $n \geq 1$  since  $\pi_{n+1}(p) \sim \pi_{n+1}(p')$  by (21) and  $(p, H_0, H'_0) \xrightarrow{\gamma} (p_1, H_1, H'_1)$  according to (23)
3.  $S_n$  is finite, for all  $n \in \mathbb{N}$ , as  $p'$  is finitely branching according to Lemma 8

Hence, the sequence  $S_1, S_2, \dots$  remains constant from some  $n$  onward and  $\cap_{n \geq 0} S_n \neq \emptyset$ . Let  $p'_1 \in \cap_{n \geq 0} S_n$ . It holds that:

- $(p', H_0, H'_0) \xrightarrow{\gamma} (p'_1, H_1, H'_1)$
- $(p_1, p'_1) \in R$  by the definition of  $R$  and  $S_n$

Symmetrically to (23), assume  $(p, p') \in R$  and  $(p', H_0, H'_0) \xrightarrow{\gamma} (p'_1, H_1, H'_1)$ . By following a similar reasoning, we can show that:

- $(p, H_0, H'_0) \xrightarrow{\gamma} (p_1, H_1, H'_1)$
- $(p_1, p'_1) \in R$  by the definition of  $R$  and  $S_n$

Hence,  $R$  is a bisimulation relation and  $p \sim p'$ . ◀

► **Theorem 4** (Soundness & Completeness).  *$E_{DNK}$  is sound and ground-complete for DyNetKAT bisimilarity.*

547 **Proof.** Soundness: if  $E_{DNK} \vdash p \equiv q$  then  $p \sim q$ , follows from Lemma 10 and Lemma 11.

548 Completeness: if  $p \sim q$  then  $E_{DNK} \vdash p \equiv q$ , is shown as follows. Without loss of generality,  
 549 assume  $p$  and  $q$  are in n.f., according to Lemma 9. We want to show that:

$$\begin{aligned} p &\equiv q \oplus p \\ q &\equiv p \oplus q \end{aligned} \quad (25)$$

551 which, by ACI of  $\oplus$  implies  $p \equiv q$ . This reduces to showing that every summand of  $p$  is a  
 552 summand of  $q$  and vice-versa. We first argue that every summand of  $p$  is a summand of  $q$ .  
 553 The reasoning is by structural induction.

554 *Base case.*

555  $\blacksquare$   $p \triangleq \perp$ . It holds by the hypothesis  $p \sim q$  that  $q \triangleq \perp$ .

556 *Induction step.*

557  $\blacksquare$   $p \triangleq ((\alpha \cdot \pi); p') \oplus p''$ . Then,  $(p, \sigma_\alpha :: H, H') \xrightarrow{(\sigma_\alpha, \sigma_\pi)} (p', H, \sigma_\pi :: H')$  implies by the  
 558 hypothesis  $p \sim q$  that  $(q, \sigma_\alpha :: H, H') \xrightarrow{(\sigma_\alpha, \sigma_\pi)} (q', H, \sigma_\pi :: H')$  and  $p' \sim q'$ . Recall  
 559 that  $q$  is in n.f.; hence, by the shape of the semantic rules in Figure 8 it holds that  
 560  $q \triangleq ((\alpha \cdot \pi); q') \oplus q''$ . By the induction hypothesis, it holds that  $p' \equiv q'$  hence,  $(\alpha \cdot \pi); p'$   
 561 is a summand of  $q$  as well.

562  $\blacksquare$  Cases  $p \triangleq (c; p') \oplus p''$  with  $c ::= x?n \mid x!n \mid \mathbf{rcfg}_{x,n}$  follow in a similar fashion.

563 Hence,  $p \equiv q \oplus p$  holds. The symmetric case  $q \equiv p \oplus q$  follows the same reasoning.  $\blacktriangleleft$

## 564 4 A Framework for Safety

565 In this section we provide a language for specifying safety properties of DyNetKAT networks,  
 566 together with a procedure for reasoning about safety in an equational fashion. Intuitively,  
 567 safety properties enable specifying undesired network behaviours.

568 **► Definition 12** (Safety Properties - Syntax). *Let  $\mathcal{A}$  be an alphabet over letters of shape  $\alpha \cdot \pi$   
 569 and  $\mathbf{rcfg}(\mathbf{x}, \mathbf{p})$ , with  $\alpha$  and  $\pi$  ranging over complete tests and assignments as in Definition 4,  
 570 and  $\mathbf{rcfg}(\mathbf{x}, \mathbf{p})$  ranging over reconfiguration actions. A safety property  $prop$  is defined as:*

$$\begin{aligned} act &::= \alpha \cdot \pi \mid \mathbf{rcfg}_{x,p} \quad (\text{where } \alpha \cdot \pi, \mathbf{rcfg}_{x,p} \in \mathcal{A}) \\ regexp &::= act \mid regexp + regexp \mid regexp \cdot regexp \\ prop &::= [regexp]false \end{aligned}$$

572 The intuition behind Definition 12 is as follows. A safety property specification  $prop$  is  
 573 satisfied whenever the behaviour encoded by  $regexp$  cannot be observed within the network.  
 574 Regular expressions  $regexp$  are defined with respect to actions  $act$ : a flow of shape  $\alpha \cdot \pi$  is  
 575 the observable behaviour of a ( $\text{NetKAT}^{\text{dup}}$ ) policy transforming a packet encoded by  $\alpha$   
 576 into  $\alpha_\pi$ , whereas  $\mathbf{rcfg}_{x,p}$  corresponds to a reconfiguration step in a network. Recursively,  
 577 a sum of regular expressions  $regexp_1 + regexp_2$  encodes the union of the two behaviours,  
 578 a concatenation of regular expressions  $regexp_1 \cdot regexp_2$  encodes the behaviour of  $regexp_1$   
 579 followed by the behaviour of  $regexp_2$ .

580 **► Definition 5** (Head Normal Forms for Safety). *Let  $\mathcal{A}$  be an alphabet over letters of shape  $\alpha \cdot \pi$   
 581 and  $\mathbf{rcfg}(\mathbf{x}, \mathbf{p})$ , with  $\alpha$  and  $\pi$  ranging over complete tests and assignments as in Definition 4,  
 582 and  $\mathbf{rcfg}(\mathbf{x}, \mathbf{p})$  ranging over reconfiguration actions. We write  $w, w'$  for (non-empty) words*

with letters in  $\mathcal{A}$  (i.e.,  $w, w' \in \mathcal{A}^*$ ) and  $|w|$  for the length of  $w$ . We write  $w' \preceq w$  whenever  $w'$  is a prefix of  $w$  (including  $w$ ).

Let  $r$  be a regular expression (regep) as in Definition 12. We call head normal form of  $r$ , denoted by  $\text{hnf}(r)$ , the sum of words obtained by distributing  $\cdot$  over  $+$  in  $r$ , in the standard fashion:

$$\begin{aligned} \text{hnf}(a) &\triangleq a \quad (a \in \mathcal{A}) \\ \text{hnf}(w) &\triangleq w \quad (w \in \mathcal{A}^*) \\ \text{hnf}(r_1 + r_2) &\triangleq \text{hnf}(r_1) + \text{hnf}(r_2) \\ \text{hnf}(r_1 \cdot (r_2 + r_3)) &\triangleq \text{hnf}(r_1 \cdot r_2) + \text{hnf}(r_1 \cdot r_3) \\ \text{hnf}((r_1 + r_2) \cdot r_3) &\triangleq \text{hnf}(r_1 \cdot r_3) + \text{hnf}(r_2 \cdot r_3) \\ \text{hnf}(r' \cdot (r_1 + r_2) \cdot r'') &\triangleq \text{hnf}(r' \cdot r_1 \cdot r'') + \text{hnf}(r' \cdot r_2 \cdot r'') \end{aligned}$$

Next, we give the formal semantics of safety properties.

► **Definition 13** (Safety Properties - Semantics). Let  $\text{Prop}$  stand for the set of all properties as in Definition 12. The semantic map  $\llbracket - \rrbracket : \text{Prop} \rightarrow \text{DyNetKAT}$  associates to each safety property in  $\text{Prop}$  a DyNetKAT expression as follows.

Let  $\Theta$  be the DyNetKAT policy (in normal form) encoding all possible behaviours over  $\mathcal{A}$ :

$$\Theta \triangleq \Sigma_{\alpha \cdot \pi \in \mathcal{A}}^{\oplus} (\alpha \cdot \pi; \perp \oplus \alpha \cdot \pi; \Theta) \oplus \Sigma_{\text{rcfg}_{x,p} \in \mathcal{A}}^{\oplus} (\text{rcfg}_{x,p}; \perp \oplus \text{rcfg}_{x,p}; \Theta)$$

Then:

$$(c_1) \quad \llbracket [\sum_{\substack{i \in I \\ w_i \in \mathcal{A}^*}} w_i] \text{false} \rrbracket \triangleq \Sigma_{\substack{w \in \mathcal{A}^* \\ |w| < M \\ \forall i \in I : w_i \not\preceq w}}^{\oplus} \bar{w}; \perp \oplus \Sigma_{\substack{w \in \mathcal{A}^* \\ |w| = M \\ \forall i \in I : w_i \not\preceq w}}^{\oplus} (\bar{w}; \perp \oplus \bar{w}; \Theta)$$

$$(c_2) \quad \llbracket [r] \text{false} \rrbracket \triangleq \llbracket [\text{hnf}(r)] \text{false} \rrbracket \quad [\text{otherwise}]$$

such that  $M$  is the length of the longest word  $w_i$ , with  $i \in I$ , and  $\bar{w}$  is a DyNetKAT-compatible term obtained from  $w$  where all letters have been separated by  $;$  and inductively defined in the obvious way:

$$\begin{aligned} \bar{a} &\triangleq a \quad (a \in \mathcal{A}) \\ \overline{a \cdot w} &\triangleq a; \bar{w} \quad (a \in \mathcal{A}, w \in \mathcal{A}^*) \end{aligned}$$

The semantic map  $\llbracket - \rrbracket : \text{Prop} \rightarrow \text{DyNetKAT}$  is defined in accordance with the intuition provided in the beginning of this section. For instance, as shown in  $(c_1)$ , if none of the sequences of steps  $w_i$  can be observed in the system, then the associated DyNetKAT term prevents the immediate execution of all  $w_i$ . Typically, safety analysis is reduced to reachability analysis. Intuitively, in our context, a safety property is violated whenever the network system under analysis displays a (finite) execution that is not in the behaviour of the property. Thus, the semantic map in Definition 13 is based on traces (or words in  $\mathcal{A}^*$ ) and is not sensitive to branching; see the use of head normal forms in  $(c_2)$ .

With these ingredients at hand, we can reason about the satisfiability of safety properties in an equational fashion.

► **Definition 14** ( $E_{DNK}^{\text{tr}}$ ). Let  $E_{DNK}^{\text{tr}}$  stand for the equational axioms in Figure 11, including the additional axiom that enables switching from the context of bisimilarity to trace equivalence of DyNetKAT policies, namely:

$$p; (q \oplus r) \equiv p; q \oplus p; r \quad (A_{16}) \tag{26}$$

615 ► **Definition 15** (Safe Network Systems). *Assume a specification given as the safety formula*  
 616 *s and a network system implemented as the DyNetKAT policy i. We say that the network is*  
 617 *safe whenever the following holds:*

$$618 \quad E_{DNK}^{tr} \vdash \llbracket s \rrbracket \oplus i \equiv \llbracket s \rrbracket \quad (27)$$

619 *In words: checking whether i satisfies s reduces to checking whether the trace behaviour of i*  
 620 *is included into that of s.*

## 621 4.1 Sugars for Safety

622 In this section we introduce a version of safety properties extended with negated actions  
 623  $(\neg(\alpha \cdot \pi))$  and, respectively,  $\neg \mathbf{rcfg}_{x,p}$ , the *true* construct and repetitions  $(r^n)$ , equally expressive  
 624 but enabling more concise property specifications.

625 ► **Definition 16** (Safety Properties - Extended Syntax). *Let  $\mathcal{A}$  be an alphabet over letters of*  
 626 *shape  $\alpha \cdot \pi$  and  $\mathbf{rcfg}_{x,p}$ , with  $\alpha$  and  $\pi$  ranging over complete tests and assignments as in*  
 627 *Definition 4, and  $\mathbf{rcfg}_{x,p}$  ranging over reconfiguration actions. Safety properties are extended*  
 628 *in the following fashion:*

$$\begin{aligned} act_e &::= \alpha \cdot \pi \mid \mathbf{rcfg}_{x,p} \mid \neg act_e & (\text{with } \alpha \cdot \pi, \mathbf{rcfg}_{x,p} \in \mathcal{A}) \\ regexp_e &::= true \mid act_e \mid regexp_e + regexp_e \mid regexp_e \cdot regexp_e \mid (regexp_e)^n & (\text{with } n \geq 1) \\ prop_e &::= [regexp_e]false \end{aligned}$$

630 Intuitively, a property of shape  $[ \neg a ]false$ , with  $a \in \mathcal{A}$ , states that the system cannot do  
 631 anything apart from  $a$  as a first step. The property  $[true]false$  states that no action can be  
 632 observed in the network, whereas  $[r^n]false$  encodes the repeated application of  $r$  for  $n$  times.

633 Let  $Reg$  and, respectively,  $Reg_e$  denote the set of regular expressions  $regexp$  in Definition 12  
 634 and, respectively, the set of regular expressions  $regexp_e$  in Definition 16. The “desugaring”  
 635 function defining the regular equivalent of the extended safety properties is defined as follows:

$$\begin{aligned} ds : Reg_e &\rightarrow Reg \\ ds(true) &\triangleq \Sigma_{a \in \mathcal{A}} a \\ ds(\neg(\alpha \cdot \pi)) &\triangleq \Sigma_{\substack{\alpha_i \cdot \pi_i \in \mathcal{A} \\ \alpha_i \neq \alpha \\ \text{or} \\ \pi_i \neq \pi}} \alpha_i \cdot \pi_i \\ 636 \quad ds(\neg \mathbf{rcfg}_{x,p}) &\triangleq \Sigma_{\substack{\mathbf{rcfg}_{y,q} \in \mathcal{A} \\ \mathbf{rcfg}_{y,q} \neq \mathbf{rcfg}_{x,p}}} \mathbf{rcfg}_{y,q} \\ ds(r^n) &\triangleq ds(\underbrace{r \cdot r \cdot \dots \cdot r}_{n \text{ times}}) \\ ds(r_1 \cdot r_2) &\triangleq ds(r_1) \cdot ds(r_2) \quad \text{if } r_1 \cdot r_2 \notin Reg \\ ds(r_1 + r_2) &\triangleq ds(r_1) + ds(r_2) \quad \text{if } r_1 + r_2 \notin Reg \\ ds(r) &\triangleq r \quad [\text{otherwise}] \end{aligned}$$

637 The (overloaded) semantic map  $\llbracket - \rrbracket : Prop_e \rightarrow \text{DyNetKAT}$  is defined as expected:

$$638 \quad \llbracket [r_e]false \rrbracket \triangleq \llbracket [ds(r_e)]false \rrbracket$$

639 For an example, consider the distributed controllers in Figure 2 and the corresponding  
 640 encoding in Figure 6. Recall that reaching  $H4$  from  $S2$  is considered a breach in the system.  
 641 This entails the safety formulae  $s_n$  defined as  $[(true)^n \cdot (\alpha \cdot \pi)]false$ , for  $n \in \mathbb{N}$ ,  $\alpha \triangleq (port = 2)$   
 642 and  $\pi \triangleq (port \leftarrow 15)$ . In words: no matter what sequence of events (of length  $n$ ) is executed,

643  $\alpha \cdot \pi$  cannot happen as the next step. Therefore, checking whether the network is safe reduces  
 644 to checking, for all  $n \in \mathbb{N}$ :

$$645 \quad E_{DNK}^{tr} \vdash \llbracket s_n \rrbracket \oplus SDN \equiv \llbracket s_n \rrbracket \quad (28)$$

646 Note that, for a fixed  $n$ , the verification procedure resembles bounded model checking [4].

## 647 5 Implementation

648 In Section 4 we introduced a notion of safety for DyNetKAT and provided a mechanism for  
 649 reasoning about safety in an equational fashion, by exploiting DyNetKAT trace semantics.  
 650 To this end, we search for traces that violate the safety property, i.e., we turn the equational  
 651 reasoning about safety into checking for reachability properties of shape  $s \triangleq \langle regexp \rangle true$ ;  
 652 for an implementation  $i$ , this is achieved by checking the following equation using our  
 653 axiomatization:  $E_{DNK}^{tr} \vdash i \oplus \llbracket s \rrbracket \equiv i$ .

654 We developed a prototype tool, called DyNetiKAT, based on Maude [7] and Python [23],  
 655 for checking the aforementioned equation. We build upon the reachability checking method in  
 656 NetKAT [2]. For a reminder: we state that  $out$  is reachable from  $in$ , in the context of a switch  
 657 policy  $p$  and topology  $t$ , whenever the following property is satisfied:  $in \cdot (p \cdot t)^* \cdot out \not\equiv \mathbf{0}$  (and  
 658 vice-versa). The inputs to our tool are a DyNetKAT program  $p$ , a list of input predicates  
 659  $in$ , a list of output predicates  $out$ , and the equivalences that describe the desired properties.  
 660 For an example, consider the stateful firewall in Figure 1 and the corresponding encoding in  
 661 Figure 5. Consider that we have the input predicates  $in \triangleq [port = int, port = ext]$ . We would  
 662 like to check if packets at port  $int$  can arrive at port  $ext$  before and after reconfiguration  
 663 events, and packets at port  $ext$  can arrive at port  $int$  only after a proper reconfiguration.  
 664 This is achieved by analysing the step by step behaviour of DyNetKAT terms in normal form  
 665 via a set of operators  $head(D)$ , and  $tail(D, R)$ , where  $R$  is a set of terms of shape  $\mathbf{rcfg}_{X,N}$ .  
 666 Intuitively, the operator  $head(D)$  returns a NetKAT policy which represents the current  
 667 configuration in the input  $D$ , and the operator  $tail(D, R)$  returns a DyNetKAT policy which  
 668 represents the configurations in the input  $D$  that appear after the events in  $R$ .

669 For the firewall example, the analysis reduces to defining the output predicates  $out \triangleq$   
 670  $[port = ext, port = int]$ , and the following properties:

$$671 \quad in(0) \cdot head(p) \cdot out(0) \not\equiv \mathbf{0} \quad (29)$$

$$672 \quad in(0) \cdot head(tail(p, \{\mathbf{rcfg}_{secConReq,1}\})) \cdot out(0) \not\equiv \mathbf{0} \quad (30)$$

$$673 \quad in(1) \cdot head(p) \cdot out(1) \equiv \mathbf{0} \quad (31)$$

$$674 \quad in(1) \cdot head(tail(p, \{\mathbf{rcfg}_{secConReq,1}\})) \cdot out(1) \not\equiv \mathbf{0} \quad (32)$$

676 Intuitively, the equivalences in (29) and (30) express that packets at port  $int$  are able to reach  
 677 to port  $ext$  in the current configuration and in the configuration after the synchronization on  
 678 the channel  $secConReq$ . The equivalence in (31) expresses that packets at port  $ext$  are not  
 679 able to reach to port  $int$  in the initial configuration and (32) expresses that the configuration  
 680 after the synchronization on the channel  $secConReq$  allows this flow.

681 We performed experiments on the FatTree topologies, which are most commonly used in  
 682 data centers, to evaluate the performance of our implementation. A FatTree is a hierarchical  
 683 tree which typically consists of 3 layers: core, aggregation and top-of-rack (ToR). The switches  
 684 at each level contain a number of redundant links to the switches at the next upper level.  
 685 The groups of ToR switches and their corresponding aggregation switches are called pods.  
 686 In Figure 12 (left) we illustrate a FatTree topology with 4 pods. For analyzing scalability,

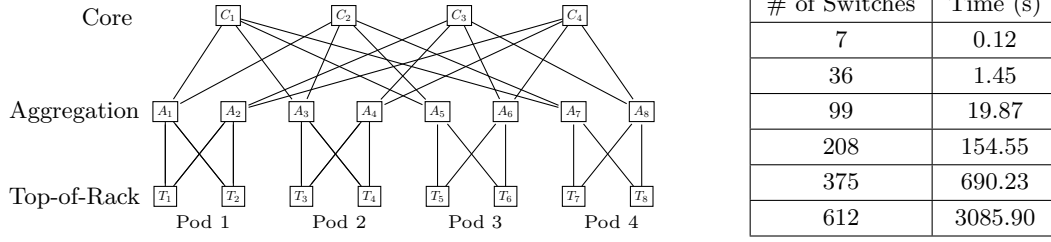

Figure 12 A FatTree Topology and Results of FatTree Experiments

we generated 6 FatTree topologies that grow in size and achieve a maximum size of 612 switches. We checked two properties on these topologies and assessed the time performance of our tool. We first computed a shortest path forwarding policy between all pairs of ToR switches in the networks and in these forwarding policies we enforced that for certain two ToR switches  $T_a$  and  $T_b$  that reside in different pods,  $T_a$  is initially not able to communicate with  $T_b$ . Accordingly, the first property that we considered is to check if  $T_b$  is reachable from  $T_a$  in the initial configuration of the network. Then, in order to check a dynamic property we considered a scenario where in an updated configuration of the network,  $T_b$  becomes accessible to  $T_a$ . In accordance with this scenario the second property that we considered is to check if  $T_b$  is reachable from  $T_a$  after a proper reconfiguration. The experiments were conducted on a computer running Ubuntu 18.04 LTS with 8 core 3.7GHz AMD Ryzen 7 2700x processors and 32 GB RAM. The results of these experiments are displayed in Figure 12 (right). The results indicate that for relatively small networks with less than 100 switches, a result is obtained in less than 20 seconds. For larger networks with sizes up to 375 switches, a result is obtained in less than 12 minutes. The experiment which contained 612 switches took the longest time with approximately 51 minutes.

In order to be able to compare our technique with another verification method, we also aimed to perform an analysis based on explicit state model checking. For this purpose, we devised an operational semantics for NetKAT and implemented it in Maude along with the operational semantics of DyNetKAT. However, this method immediately failed at scaling even for small networks, hence, we did not perform further analysis by using this method.

DyNetiKAT is available for download at: <https://github.com/hcantunc/DyNetiKAT>.

## 6 Conclusions

We developed a language, called DyNetKAT for modelling and reasoning about dynamic reconfigurations in Software Defined Networks. Our language builds upon the concepts, syntax, and semantics of NetKAT and hence, provides a modular extension and makes it possible to reuse the theory and tools of NetKAT. We define a formal semantics for our language and provide a sound and ground-complete axiomatization. We exploit our axiomatization to analyse reachability properties of dynamic networks and show that our approach is indeed scalable to networks with hundreds of switches.

Our language builds upon the assumption that control plane updates interleave with data plane packet processing in such a way that each data plane packet sees one set of flow tables throughout their flight in the network. This assumption is inspired by the framework put forward by Reitblatt et al. [21] and is motivated by the requirement to design a modular extension on top of NetKAT. However, we have experimented with a much smaller-stepped semantics in which the control plane updates can have a finer interleaving with in-flight

packet moves. This alternative language breaks the hierarchy with NetKAT and a naive treatment of this alternative semantics will lead to much larger state-spaces. We would like to investigate this small-step semantics and efficient analysis techniques for it further.

## A Soundness Proofs

■ Axiom under consideration:

$$\mathbf{0}; p \equiv \perp \quad (A0) \tag{33}$$

for  $p \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the derivations of the term  $\mathbf{0}; p$  are as follows:

(a)

$$\text{For all } \sigma' \in \llbracket \mathbf{0} \rrbracket(\sigma::\langle \rangle) : (\mathbf{cpol}'_{-};) \frac{}{(\mathbf{0}; p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')}$$

However, observe that  $\llbracket \mathbf{0} \rrbracket(\sigma::\langle \rangle)$  is equal to empty set:

$$\llbracket \mathbf{0} \rrbracket(\sigma::\langle \rangle) = \{\} \quad (\text{Definition of } \mathbf{0}) \tag{34}$$

Hence, the term  $\mathbf{0}; p$  does not afford any transition. Similarly, observe that according to the semantic rules of DyNetKAT, the term  $\perp$  does not afford any transition. Hence, the following trivially holds:

$$(\mathbf{0}; p) \sim \perp \tag{35}$$

■ Axiom under consideration:

$$p \oplus q \equiv q \oplus p \quad (A2) \tag{36}$$

for  $p, q \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are the possible transitions that can initially occur in the terms  $p \oplus q$  and  $q \oplus p$ :

$$\begin{cases} (1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\ (2) (q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \end{cases}$$

$$\gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$$

$$\text{Case (1): } (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$$

The derivations of  $p \oplus q$  are as follows:

(a)

$$(\mathbf{cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}$$

859 The derivations of  $q \oplus p$  are as follows:

(b)

$$860 \quad (\mathbf{cpol}_{\oplus-}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(q \oplus p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}$$

861 As demonstrated in (a) and (b), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then both of the  
862 terms  $p \oplus q$  and  $q \oplus p$  converge to the same expression with the  $\gamma$  transition:

$$863 \quad \begin{aligned} & (p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\ & (q \oplus p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \end{aligned} \quad (37)$$

864 **Case (2):**  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$

865

866 The derivations of  $p \oplus q$  are as follows:

(c)

$$867 \quad (\mathbf{cpol}_{\oplus-}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}$$

868 The derivations of  $q \oplus p$  are as follows:

(d)

$$869 \quad (\mathbf{cpol}_{-\oplus}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(q \oplus p, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}$$

870 As demonstrated in (c) and (d), if  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$  holds then both of the  
871 terms  $p \oplus q$  and  $q \oplus p$  converge to the same expression with the  $\gamma$  transition:

$$872 \quad \begin{aligned} & (p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \\ & (q \oplus p, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \end{aligned} \quad (38)$$

873 Therefore, by (37) and (38) it is straightforward to conclude that the following holds:

$$874 \quad (p \oplus q) \sim (q \oplus p) \quad (39)$$

875

876 ■ Axiom under consideration:

$$877 \quad (p \oplus q) \oplus r \equiv p \oplus (q \oplus r) \quad (A3) \quad (40)$$

878 for  $p, q, r \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are  
879 the possible transitions that can initially occur in the terms  $(p \oplus q) \oplus r$  and  $p \oplus (q \oplus r)$ :

$$880 \quad \begin{cases} (1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\ (2) (q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \\ (3) (r, H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1) \end{cases}$$

881

$$882 \quad \gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$$

883 **Case (1):**  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$

884

885 The derivations of  $(p \oplus q) \oplus r$  are as follows:

(a)

$$\begin{array}{c} \text{886} \\ \text{(cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)} \\ \text{(cpol}_{-\oplus}) \frac{}{((p \oplus q) \oplus r, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)} \end{array}$$

887 The derivations of  $p \oplus (q \oplus r)$  are as follows:

(b)

$$\text{888} \quad \text{(cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus (q \oplus r), H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}$$

889 As demonstrated in (a) and (b), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then both of the  
890 terms  $(p \oplus q) \oplus r$  and  $p \oplus (q \oplus r)$  converge to the same expression with the  $\gamma$  transition:

$$\begin{array}{c} \text{891} \\ ((p \oplus q) \oplus r, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\ (p \oplus (q \oplus r), H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \end{array} \quad (41)$$

892 **Case (2):**  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$

893

894 The derivations of  $(p \oplus q) \oplus r$  are as follows:

(c)

$$\begin{array}{c} \text{895} \\ \text{(cpol}_{\oplus-}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)} \\ \text{(cpol}_{-\oplus}) \frac{}{((p \oplus q) \oplus r, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)} \end{array}$$

896 The derivations of  $p \oplus (q \oplus r)$  are as follows:

(d)

$$\begin{array}{c} \text{897} \\ \text{(cpol}_{-\oplus}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(q \oplus r, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)} \\ \text{(cpol}_{\oplus-}) \frac{}{(p \oplus (q \oplus r), H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)} \end{array}$$

898 As demonstrated in (c) and (d), if  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$  holds then both of the  
899 terms  $(p \oplus q) \oplus r$  and  $p \oplus (q \oplus r)$  converge to the same expression with the  $\gamma$  transition:

$$\begin{array}{c} \text{900} \\ ((p \oplus q) \oplus r, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \\ (p \oplus (q \oplus r), H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \end{array} \quad (42)$$

901 **Case (3):**  $(r, H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1)$

902

903 The derivations of  $(p \oplus q) \oplus r$  are as follows:

(e)

$$\text{904} \quad \text{(cpol}_{\oplus-}) \frac{(r, H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1)}{((p \oplus q) \oplus r, H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1)}$$

The derivations of  $p \oplus (q \oplus r)$  are as follows:

(f)

$$\frac{(\mathbf{cpol}_{\oplus-}) \frac{(r, H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1)}{(q \oplus r, H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1)}}{(\mathbf{cpol}_{\oplus-}) \frac{}{(p \oplus (q \oplus r), H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1)}}$$

As demonstrated in (e) and (f), if  $(r, H_0, H'_0) \xrightarrow{\gamma} (r', H_1, H'_1)$  holds then both of the terms  $(p \oplus q) \oplus r$  and  $p \oplus (q \oplus r)$  converge to the same expression with the  $\gamma$  transition:

$$\begin{aligned} ((p \oplus q) \oplus r, H_0, H'_0) &\xrightarrow{\gamma} (r', H_1, H'_1) \\ (p \oplus (q \oplus r), H_0, H'_0) &\xrightarrow{\gamma} (r', H_1, H'_1) \end{aligned} \quad (43)$$

Therefore, by (41), (42) and (43) it is straightforward to conclude that the following holds:

$$((p \oplus q) \oplus r) \sim (p \oplus (q \oplus r)) \quad (44)$$

■ Axiom under consideration:

$$p \oplus p \equiv p \quad (A4) \quad (45)$$

for  $p \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are the possible transitions that can initially occur in the terms  $p \oplus p$  and  $p$ :

$$\left\{ (1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \right.$$

$$\gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$$

**Case (1):**  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$

The derivations of  $p \oplus p$  are as follows:

(a)

$$(\mathbf{cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}$$

(b)

$$(\mathbf{cpol}_{\oplus-}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}$$

As demonstrated in (a) and (b), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then it is also the case that the term  $p \oplus p$  evolves into the same expression with the  $\gamma$  transition:

$$(p \oplus p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \quad (46)$$

Hence, it is straightforward to conclude that the following holds:

$$(p \oplus p) \sim p \quad (47)$$

931 ■ Axiom under consideration:

$$932 \quad p \oplus \perp \equiv p \quad (A5) \quad (48)$$

933 for  $p \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are the  
934 possible transitions that can initially occur in the terms  $p \oplus \perp$  and  $p$ :

$$935 \quad \left\{ (1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \right.$$

$$936 \quad \gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$$

$$937 \quad \mathbf{Case (1):} (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$$

938

939 The derivations of  $p \oplus \perp$  are as follows:

(a)

$$941 \quad (\mathbf{cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus \perp, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}$$

942 As demonstrated in (a), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then it is also the case that  
943 the term  $p \oplus \perp$  evolves into the same expression with the  $\gamma$  transition:

$$944 \quad (p \oplus \perp, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \quad (49)$$

945 Hence, it is straightforward to conclude that the following holds:

$$946 \quad (p \oplus \perp) \sim p \quad (50)$$

947 ■ Axiom under consideration:

$$948 \quad p \parallel q \equiv q \parallel p \quad (A6) \quad (51)$$

949 for  $p, q \in \text{DyNetKAT}$ . The soundness proof of the axiom (A6) follows by induction on  
950 the size of the syntactic tree associated to  $p \parallel q$ . Without loss of generality, assume  $p$  and  
951  $q$  are in n.f. The size of  $p \parallel q$  is then defined as follows:

$$952 \quad \text{size}(\perp) = 1 \quad (52)$$

$$953 \quad \text{size}(\alpha \cdot \pi; t) = 2 + \text{size}(t) \quad (53)$$

$$954 \quad \text{size}(x?z; t) = 2 + \text{size}(t) \quad (54)$$

$$955 \quad \text{size}(x!z; t) = 2 + \text{size}(t) \quad (55)$$

$$956 \quad \text{size}(\mathbf{rcfg}_{x,z}; t) = 2 + \text{size}(t) \quad (56)$$

$$957 \quad \text{size}(p \oplus q) = 1 + \text{size}(p) + \text{size}(q) \quad (57)$$

$$958 \quad \text{size}(p \parallel q) = 1 + \text{size}(p) + \text{size}(q) \quad (58)$$

959 *Base case.*

960 ■  $\text{size}(p \parallel q) = 3$ . It follows that  $p \triangleq \perp$  and  $q \triangleq \perp$ . Therefore, the soundness of (A6)  
961 trivially holds.

962 *Induction step.* Assume (A6) is sound for all  $p, q$  such that  $\text{size}(p \parallel q) \leq M$ , with  $M \in \mathbb{N}$ .  
963 We want to show that (A6) is sound for all  $p, q$  such that  $\text{size}(p \parallel q) > M$ .

966 (i)  $p \triangleq \perp$ . Then, it is straightforward to observe that both  $\perp \parallel q$  and  $q \parallel \perp$  evolve  
 967 according to the semantic rules corresponding to  $q$ . Hence, we can safely conclude that  
 968  $(\perp \parallel q) \sim (q \parallel \perp)$  holds.

969 (ii)  $p \triangleq \alpha \cdot \pi; p'$ . Consider an arbitrary but fixed network packet  $\sigma$ , let  $S_{\alpha\pi} \triangleq \llbracket \alpha \cdot \pi \rrbracket(\sigma; \cdot)$ .  
 970 The first step derivations entailed by  $p$  in a context  $p \parallel t$  are as follows:

(a)

$$\begin{array}{c} \text{For all } \sigma' \in S_{\alpha\pi} : \quad (\mathbf{cpol}_{-}^{\vee}) \frac{}{(\alpha \cdot \pi; p', \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p', H, \sigma' :: H')} \\ 971 \quad (\mathbf{cpol}_{-||}) \frac{}{((\alpha \cdot \pi; p') \parallel t, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p' \parallel t, H, \sigma' :: H')} \end{array}$$

972 The first step derivations entailed by  $p$  in a context  $t \parallel p$  are as follows:

(b)

$$\begin{array}{c} \text{For all } \sigma' \in S_{\alpha\pi} : \quad (\mathbf{cpol}_{-}^{\vee}) \frac{}{(\alpha \cdot \pi; p', \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p', H, \sigma' :: H')} \\ 973 \quad (\mathbf{cpol}_{||-}) \frac{}{(t \parallel (\alpha \cdot \pi; p'), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (t \parallel p', H, \sigma' :: H')} \end{array}$$

974 Hence, given that  $q$  in n.f. always evolves into a term  $t$  with simpler structure (according  
 975 to the DyNetKAT semantic rules), and based on the induction hypothesis, it is safe to  
 976 conclude that  $(p \parallel q) \sim (q \parallel p)$ .

977 (iii)  $p \triangleq \mathbf{rcfg}_{x,z}; p'$ . The reasoning is similar to (ii) above.

978 (iv)  $p \triangleq x?z; p'$ . The first step of asynchronous derivations entailed by  $p$  in a context  $p \parallel t$   
 979 are as follows:

(a)

$$\begin{array}{c} (\mathbf{cpol}_{?}) \frac{}{(x?z; p', H, H') \xrightarrow{x?z} (p', H, H')} \\ 980 \quad (\mathbf{cpol}_{-||}) \frac{}{((x?z; p') \parallel t, H, H') \xrightarrow{x?z} (p' \parallel t, H, H')} \end{array}$$

981 The first step of asynchronous derivations entailed by  $p$  in a context  $t \parallel p$  are as follows:

(b)

$$\begin{array}{c} (\mathbf{cpol}_{?}) \frac{}{(x?z; p', H, H') \xrightarrow{x?z} (p', H, H')} \\ 982 \quad (\mathbf{cpol}_{||-}) \frac{}{(t \parallel (x?z; p'), H, H') \xrightarrow{x?z} (t \parallel p', H, H')} \end{array}$$

983 Furthermore, if  $q$  has a summand of shape  $x!z; q'$ , then:

984 The first step synchronous derivations of  $p \parallel q$  are as follows:

(c)

$$\begin{array}{c} (\mathbf{cpol}_{?}) \frac{}{(x?z; p', H, H') \xrightarrow{x?z} (p', H, H')} \quad (\mathbf{cpol}_{!}) \frac{}{(x!z; q', H, H') \xrightarrow{x!z} (q', H, H')} \\ 985 \quad (\mathbf{cpol}_{?!}) \frac{}{((x?z; p') \parallel (x!z; q'), H, H') \xrightarrow{\mathbf{rcfg}(x,z)} (p' \parallel q', H, H')} \end{array}$$

986

987 The first step synchronous derivations of  $q \parallel p$  are as follows:

(d)

$$\begin{array}{c}
\text{(cpol}_! \text{)} \frac{}{(x!z; q', H, H') \xrightarrow{x!z} (q', H, H')} \quad \text{(cpol}_? \text{)} \frac{}{(x?z; p', H, H') \xrightarrow{x?z} (p', H, H')} \\
\text{(cpol}_{!?} \text{)} \frac{}{((x!z; q') \parallel (x?z; p'), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel p', H, H')}
\end{array}$$

In connection with (iv)(a) and (iv)(b) above, note that  $q$  in n.f. always evolves into a term  $t$  with simpler structure (according to the DyNetKAT semantic rules). This, together with the observations in (iv)(c) and (iv)(d), and based on the induction hypothesis, enable us to safely to conclude that  $(p \parallel q) \sim (q \parallel p)$ .

(v)  $p \triangleq x!z; p'$ . The reasoning is similar to (iv) above.

(vi)  $p \triangleq p_1 \oplus p_2$  where  $p_1$  and  $p_2$  are in n.f. Without loss of generality, assume  $p_1 ::= \alpha \cdot \pi; p'_1 \mid \mathbf{rcfg}_{x,z}; p'_1 \mid x?z; p'_1 \mid x!z; p'_1$  and assume  $(p_1, H_0, H'_0) \xrightarrow{\gamma} (p'_1, H_1, H'_1)$ . The derivation entailed by  $p_1$  in  $p$  is as follows:

$$\text{(cpol}_{-\oplus} \text{)} \frac{(p_1, H_0, H'_0) \xrightarrow{\gamma} (p'_1, H_1, H'_1)}{(p_1 \oplus p_2, H_0, H'_0) \xrightarrow{\gamma} (p'_1, H_1, H'_1)}$$

From this point onward, showing that the first step derivations entailed by  $p_1$  in a context  $p \parallel t$  correspond to the first step derivations entailed by  $p_1$  in a context  $t \parallel p$  follows the reasoning in (ii)–(v), with  $p_1$  ranging over terms of shape  $(\alpha \cdot \pi; p'_1), (\mathbf{rcfg}_{x,z}; p'_1), (x!z; p'_1)$  and  $(x?z; p'_1)$ , respectively. Hence, given that  $q$  in n.f. always evolves into a term  $t$  with simpler structure (according to the DyNetKAT semantic rules), and based on the induction hypothesis, it is safe to conclude that  $(p \parallel q) \sim (q \parallel p)$ .

■ Axiom under consideration:

$$p \parallel \perp \equiv p \quad (A7) \tag{59}$$

for  $p \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, observe that both  $p \parallel \perp$  and  $p$  evolve according to the semantic rules corresponding to  $p$ . Hence, it is straightforward to conclude that the following holds:

$$(p \parallel \perp) \sim p \tag{60}$$

■ Axiom under consideration:

$$p \parallel q \equiv p \parallel q \oplus q \parallel p \oplus p \mid q \quad (A8) \tag{61}$$

for  $p, q \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are the possible transitions that can initially occur in the terms  $p \parallel q$  and  $p \parallel q \oplus q \parallel p \oplus p \mid q$ :

$$\begin{cases}
(1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\
(2) (q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \\
(3) (p, H_0, H'_0) \xrightarrow{x!z} (p', H_1, H'_1) & (q, H_0, H'_0) \xrightarrow{x?z} (q', H_1, H'_1) \\
(4) (p, H_0, H'_0) \xrightarrow{x?z} (p', H_1, H'_1) & (q, H_0, H'_0) \xrightarrow{x!z} (q', H_1, H'_1)
\end{cases}$$

1018  $\gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$

1019 **Case (1):**  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$

1020

1021 The derivations of  $p \parallel q$  are as follows:

(a)

$$1022 \quad (\mathbf{cpol}_{-\parallel}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \parallel q, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel q, H_1, H'_1)}$$

1023 The derivations of  $p \parallel q \oplus q \parallel p \oplus p \mid q$  are as follows:

(b)

$$1024 \quad (\mathbb{I}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \parallel q, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel q, H_1, H'_1)} \\ (\mathbf{cpol}_{-\oplus}) \frac{(p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel q, H_1, H'_1)}{(p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel q, H_1, H'_1)}$$

1025 As demonstrated in (a) and (b), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then both of the  
1026 terms  $p \parallel q$  and  $p \parallel q \oplus q \parallel p \oplus p \mid q$  converge to the same expression with the  $\gamma$  transition:

$$1027 \quad \begin{aligned} (p \parallel q, H_0, H'_0) &\xrightarrow{\gamma} (p' \parallel q, H_1, H'_1) \\ (p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) &\xrightarrow{\gamma} (p' \parallel q, H_1, H'_1) \end{aligned} \quad (62)$$

1028 **Case (2):**  $(q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$

1029

1030 The derivations of  $p \parallel q$  are as follows:

(c)

$$1031 \quad (\mathbf{cpol}_{\parallel-}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \parallel q, H_0, H'_0) \xrightarrow{\gamma} (p \parallel q', H_1, H'_1)}$$

1032 The derivations of  $p \parallel q \oplus q \parallel p \oplus p \mid q$  are as follows:

(d)

$$1033 \quad (\mathbb{I}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(q \parallel p, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel p, H_1, H'_1)} \\ (\mathbf{cpol}_{\oplus-}) \frac{(p \parallel q \oplus q \parallel p, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel p, H_1, H'_1)}{(p \parallel q \oplus q \parallel p, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel p, H_1, H'_1)} \\ (\mathbf{cpol}_{-\oplus}) \frac{(p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel p, H_1, H'_1)}{(p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel p, H_1, H'_1)}$$

1034 As demonstrated in (c) and (d), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then both of the  
1035 terms  $p \parallel q$  and  $p \parallel q \oplus q \parallel p \oplus p \mid q$  are able to perform the  $\gamma$  transition:

$$1036 \quad \begin{aligned} (p \parallel q, H_0, H'_0) &\xrightarrow{\gamma} (p \parallel q', H_1, H'_1) \\ (p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) &\xrightarrow{\gamma} (q' \parallel p, H_1, H'_1) \end{aligned} \quad (63)$$

1037 Observe that the terms evolve into different expressions, however, according to the axiom  
1038 A6 the “ $\parallel$ ” operator is commutative. Hence, the following holds:

$$1039 \quad (p \parallel q') \sim (q' \parallel p) \quad (64)$$

1040 **Case (3):**  $(p, H_0, H'_0) \xrightarrow{x!z} (p', H_1, H'_1) \quad (q, H_0, H'_0) \xrightarrow{x?z} (q', H_1, H'_1)$

1041

1042 The derivations of  $p \parallel q$  are as follows:

(e)

$$1043 \quad (\mathbf{cpol}_{!?}) \frac{(p, H_0, H'_0) \xrightarrow{x!z} (p', H_1, H'_1) \quad (q, H_0, H'_0) \xrightarrow{x?z} (q', H_1, H'_1)}{(p \parallel q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)}$$

1044 The derivations of  $p \parallel q \oplus q \parallel p \oplus p \mid q$  are as follows:

(f)

$$1045 \quad (\mathbf{cpol}_{!?}) \frac{(p, H_0, H'_0) \xrightarrow{x!z} (p', H_1, H'_1) \quad (q, H_0, H'_0) \xrightarrow{x?z} (q', H_1, H'_1)}{(p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)} \\ (\mathbf{cpol}_{\oplus\_}) \frac{(p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)}{(p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)}$$

1046 As demonstrated in (e) and (f), if  $(p, H_0, H'_0) \xrightarrow{x!z} (p', H_1, H'_1)$  and  $(q, H_0, H'_0) \xrightarrow{x?z} (q', H_1, H'_1)$  hold then both of the terms  $p \parallel q$  and  $p \parallel q \oplus q \parallel p \oplus p \mid q$  converge to the same expression with the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$1049 \quad (p \parallel q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1) \\ (p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1) \quad (65)$$

1050 **Case (4):**  $(p, H_0, H'_0) \xrightarrow{x?z} (p', H_1, H'_1) \quad (q, H_0, H'_0) \xrightarrow{x!z} (q', H_1, H'_1)$

1051

1052 The derivations of  $p \parallel q$  are as follows:

(g)

$$1053 \quad (\mathbf{cpol}_{?!}) \frac{(p, H_0, H'_0) \xrightarrow{x?z} (p', H_1, H'_1) \quad (q, H_0, H'_0) \xrightarrow{x!z} (q', H_1, H'_1)}{(p \parallel q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)}$$

1054 The derivations of  $p \parallel q \oplus q \parallel p \oplus p \mid q$  are as follows:

(h)

$$1055 \quad (\mathbf{cpol}_{?!}) \frac{(p, H_0, H'_0) \xrightarrow{x?z} (p', H_1, H'_1) \quad (q, H_0, H'_0) \xrightarrow{x!z} (q', H_1, H'_1)}{(p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)} \\ (\mathbf{cpol}_{\oplus\_}) \frac{(p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)}{(p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1)}$$

1056 As demonstrated in (g) and (h), if  $(p, H_0, H'_0) \xrightarrow{x?z} (p', H_1, H'_1)$  and  $(q, H_0, H'_0) \xrightarrow{x!z} (q', H_1, H'_1)$  hold then both of the terms  $p \parallel q$  and  $p \parallel q \oplus q \parallel p \oplus p \mid q$  converge to the same expression with the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$1059 \quad (p \parallel q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1) \\ (p \parallel q \oplus q \parallel p \oplus p \mid q, H_0, H'_0) \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H_1, H'_1) \quad (66)$$

Therefore, by (62), (63), (64), (65) and (66) it is straightforward to conclude that the following holds:

$$(p \parallel q) \sim (p \parallel q \oplus q \parallel p \oplus p \parallel q) \quad (67)$$

■ Axiom under consideration:

$$\perp \parallel p \equiv \perp \quad (A9) \quad (68)$$

for  $p \in \text{DyNetKAT}$ . Observe that according to the semantic rules of DyNetKAT, the terms  $\perp \parallel p$  and  $\perp$  do not afford any transition. Hence, the following trivially holds:

$$(\perp \parallel p) \sim \perp \quad (69)$$

■ Axiom under consideration:

$$(a; p) \parallel q \equiv a; (p \parallel q) \quad (A10) \quad (70)$$

for  $a \in \{z, x?z, x!z, \mathbf{rcfg}_{x,z}\}$ ,  $z \in \text{NetKAT}^{-\text{dup}}$  and  $p, q \in \text{DyNetKAT}$ . In the following, we make a case analysis on the shape of  $a$  and show that the terms  $(a; p) \parallel q$  and  $a; (p \parallel q)$  are bisimilar.

**Case (1):**  $a \triangleq z$

Consider an arbitrary but fixed network packet  $\sigma$ , let  $S_z \triangleq \llbracket z \rrbracket(\sigma; \langle \rangle)$ . The derivations of  $(z; p) \parallel q$  are as follows:

$$(a) \quad \text{For all } \sigma' \in S_z : \quad \frac{(\mathbf{cpol}'_{-;}) \frac{(z; p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')}{(\parallel)} \quad ((z; p) \parallel q, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p \parallel q, H, \sigma' :: H)}$$

The derivations of  $z; (p \parallel q)$  are as follows:

$$(b) \quad \text{For all } \sigma' \in S_z : \quad \frac{(\mathbf{cpol}'_{-;}) \frac{(z; (p \parallel q), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p \parallel q, H, \sigma' :: H')}{(\parallel)} \quad ((z; p) \parallel q, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p \parallel q, H, \sigma' :: H)}$$

As demonstrated in (a) and (b), both of the terms  $(z; p) \parallel q$  and  $z; (p \parallel q)$  initially afford the same set of transitions of shape  $(\sigma, \sigma')$  and they converge to the same expression after taking these transitions:

$$\begin{aligned} ((z; p) \parallel q, \sigma :: H, H') &\xrightarrow{(\sigma, \sigma')} (p \parallel q, H, \sigma' :: H') \\ (z; (p \parallel q), \sigma :: H, H') &\xrightarrow{(\sigma, \sigma')} (p \parallel q, H, \sigma' :: H') \end{aligned} \quad (71)$$

**Case (2):**  $a \triangleq x?z$

The derivations of  $(x?z; p) \parallel q$  are as follows:

(c)

$$\begin{array}{c} \text{(cpol}_?) \\ \hline (x?z; p, H, H') \xrightarrow{x?z} (p, H, H') \\ \hline (\parallel) \\ \hline ((x?z; p) \parallel q, H, H') \xrightarrow{x?z} (p \parallel q, H, H') \end{array}$$

 The derivations of  $x?z; (p \parallel q)$  are as follows:

(d)

$$\begin{array}{c} \text{(cpol}_?) \\ \hline (x?z; (p \parallel q), H, H') \xrightarrow{x?z} (p \parallel q, H, H') \end{array}$$

As demonstrated in (c) and (d), both of the terms  $(x?z; p) \parallel q$  and  $x?z; (p \parallel q)$  initially only afford the  $x?z$  transition and they converge to the same expression after taking this transition:

$$\begin{array}{c} ((x?z; p) \parallel q, H, H') \xrightarrow{x?z} (p \parallel q, H, H') \\ (x?z; (p \parallel q), H, H') \xrightarrow{x?z} (p \parallel q, H, H') \end{array} \quad (72)$$

**Case (3):**  $a \triangleq x!z$

 The derivations of  $(x!z; p) \parallel q$  are as follows:

(e)

$$\begin{array}{c} \text{(cpol}_!) \\ \hline (x!z; p, H, H') \xrightarrow{x!z} (p, H, H') \\ \hline (\parallel) \\ \hline ((x!z; p) \parallel q, H, H') \xrightarrow{x!z} (p \parallel q, H, H') \end{array}$$

 The derivations of  $x!z; (p \parallel q)$  are as follows:

(f)

$$\begin{array}{c} \text{(cpol}_!) \\ \hline (x!z; (p \parallel q), H, H') \xrightarrow{x!z} (p \parallel q, H, H') \end{array}$$

As demonstrated in (e) and (f), both of the terms  $(x!z; p) \parallel q$  and  $x!z; (p \parallel q)$  initially only afford the  $x!z$  transition and they converge to the same expression after taking this transition:

$$\begin{array}{c} ((x!z; p) \parallel q, H, H') \xrightarrow{x!z} (p \parallel q, H, H') \\ (x!z; (p \parallel q), H, H') \xrightarrow{x!z} (p \parallel q, H, H') \end{array} \quad (73)$$

**Case (4):**  $a \triangleq \mathbf{rcfg}_{x,z}$

 The derivations of  $(\mathbf{rcfg}_{x,z}; p) \parallel q$  are as follows:

(g)

$$\begin{array}{c} \text{(rcfg}_{\mathbf{x}, \mathbf{z}}) \\ \hline (\mathbf{rcfg}_{x,z}; p, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p, H, H') \\ \hline (\parallel) \\ \hline ((\mathbf{rcfg}_{x,z}; p) \parallel q, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p \parallel q, H, H') \end{array}$$

1110 The derivations of  $\mathbf{rcfg}_{x,z};(p \parallel q)$  are as follows:

(h)

$$1111 \quad \frac{(\mathbf{rcfg}_{\mathbf{x},\mathbf{z}})}{(\mathbf{rcfg}_{x,z};(p \parallel q), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x},\mathbf{z})} (p \parallel q, H, H')}$$

1112 As demonstrated in (g) and (h), both of the terms  $(\mathbf{rcfg}_{x,z};p) \parallel q$  and  $\mathbf{rcfg}_{x,z};(p \parallel q)$   
 1113 initially only afford the  $\mathbf{rcfg}(\mathbf{x},\mathbf{z})$  transition and they converge to the same expression  
 1114 after taking this transition:

$$1115 \quad \begin{aligned} & ((\mathbf{rcfg}_{x,z};p) \parallel q, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x},\mathbf{z})} (p \parallel q, H, H') \\ & (\mathbf{rcfg}_{x,z};(p \parallel q), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x},\mathbf{z})} (p \parallel q, H, H') \end{aligned} \quad (74)$$

1116 Therefore, by (71), (72), (73) and (74) it is straightforward to conclude that the following  
 1117 holds:

$$1118 \quad ((a;p) \parallel q) \sim (a;(p \parallel q)) \quad (75)$$

1119

1120 ■ Axiom under consideration:

$$1121 \quad (p \oplus q) \parallel r \equiv (p \parallel r) \oplus (q \parallel r) \quad (A11) \quad (76)$$

1122 for  $p, q, r \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are  
 1123 the possible transitions that can initially occur in the terms  $(p \oplus q) \parallel r$  and  $(p \parallel r) \oplus (q \parallel r)$ :

$$1124 \quad \begin{cases} (1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\ (2) (q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \end{cases}$$

$$1126 \quad \gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$$

$$1127 \quad \textbf{Case (1): } (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$$

1128

1129 The derivations of  $(p \oplus q) \parallel r$  are as follows:

(a)

$$1130 \quad \begin{aligned} & (\mathbf{cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)} \\ & (\parallel) \frac{((p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1))}{((p \oplus q) \parallel r, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel r, H_1, H'_1)} \end{aligned}$$

1131 The derivations of  $(p \parallel r) \oplus (q \parallel r)$  are as follows:

(b)

$$1132 \quad \begin{aligned} & (\parallel) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \parallel r, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel r, H_1, H'_1)} \\ & (\mathbf{cpol}_{-\oplus}) \frac{((p \parallel r, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel r, H_1, H'_1))}{((p \parallel r) \oplus (q \parallel r), H_0, H'_0) \xrightarrow{\gamma} (p' \parallel r, H_1, H'_1)} \end{aligned}$$

As demonstrated in (a) and (b), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then both of the terms  $(p \oplus q) \parallel r$  and  $(p \parallel r) \oplus (q \parallel r)$  converge to the same expression with the  $\gamma$  transition:

$$\begin{aligned} & ((p \oplus q) \parallel r, H_0, H'_0) \xrightarrow{\gamma} (p' \parallel r, H_1, H'_1) \\ & ((p \parallel r) \oplus (q \parallel r), H_0, H'_0) \xrightarrow{\gamma} (p' \parallel r, H_1, H'_1) \end{aligned} \quad (77)$$

**Case (2):**  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$

The derivations of  $(p \oplus q) \parallel r$  are as follows:

(c)

$$\begin{aligned} & \text{(cpol}_{\oplus-}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)} \\ & \text{(\parallel)} \frac{}{((p \oplus q) \parallel r, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel r, H_1, H'_1)} \end{aligned}$$

The derivations of  $(p \parallel r) \oplus (q \parallel r)$  are as follows:

(d)

$$\begin{aligned} & \text{(\parallel)} \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(q \parallel r, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel r, H_1, H'_1)} \\ & \text{(cpol}_{\oplus-}) \frac{}{((p \parallel r) \oplus (q \parallel r), H_0, H'_0) \xrightarrow{\gamma} (q' \parallel r, H_1, H'_1)} \end{aligned}$$

As demonstrated in (c) and (d), if  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$  holds then both of the terms  $(p \oplus q) \parallel r$  and  $(p \parallel r) \oplus (q \parallel r)$  converge to the same expression with the  $\gamma$  transition:

$$\begin{aligned} & ((p \oplus q) \parallel r, H_0, H'_0) \xrightarrow{\gamma} (q' \parallel r, H_1, H'_1) \\ & ((p \parallel r) \oplus (q \parallel r), H_0, H'_0) \xrightarrow{\gamma} (q' \parallel r, H_1, H'_1) \end{aligned} \quad (78)$$

Therefore, by (77) and (78) it is straightforward to conclude that the following holds:

$$((p \oplus q) \parallel r) \sim ((p \parallel r) \oplus (q \parallel r)) \quad (79)$$

1147

1148 ■ Axiom under consideration:

$$(p \oplus q) \mid r \equiv (p \mid r) \oplus (q \mid r) \quad (A13) \quad (80)$$

for  $p, q, r \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are the possible transitions that can initially occur in the terms  $(p \oplus q) \mid r$  and  $(p \mid r) \oplus (q \mid r)$ :

$$\left\{ \begin{array}{ll} (1) (p, H, H') \xrightarrow{x!z} (p', H, H') & (r, H, H') \xrightarrow{x?z} (r', H, H') \\ (2) (p, H, H') \xrightarrow{x?z} (p', H, H') & (r, H, H') \xrightarrow{x!z} (r', H, H') \\ (3) (q, H, H') \xrightarrow{x!z} (q', H, H') & (r, H, H') \xrightarrow{x?z} (r', H, H') \\ (4) (q, H, H') \xrightarrow{x?z} (q', H, H') & (r, H, H') \xrightarrow{x!z} (r', H, H') \end{array} \right.$$

**Case (1):**  $(p, H, H') \xrightarrow{x!z} (p', H, H') \quad (r, H, H') \xrightarrow{x?z} (r', H, H')$

The derivations of  $(p \oplus q) \mid r$  are as follows:

(a)

$$\begin{array}{c}
1158 \quad (\mathbf{cpol}_{-\oplus}) \frac{(p, H, H') \xrightarrow{x!z} (p', H, H')}{(p \oplus q, H, H') \xrightarrow{x!z} (p', H, H')} \quad \frac{}{(r, H, H') \xrightarrow{x?z} (r', H, H')} \\
\frac{(|?)}{((p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')}
\end{array}$$

1159 The derivations of  $(p \mid r) \oplus (q \mid r)$  are as follows:

(b)

$$\begin{array}{c}
1160 \quad \frac{(|?) \frac{(p, H, H') \xrightarrow{x!z} (p', H, H') \quad (r, H, H') \xrightarrow{x?z} (r', H, H')}{(p \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')}}{((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')} \\
(\mathbf{cpol}_{-\oplus})
\end{array}$$

1161 As demonstrated in (a) and (b), if  $(p, H, H') \xrightarrow{x!z} (p', H, H')$  and  $(r, H, H') \xrightarrow{x!z} (r', H, H')$  hold then both of the terms  $(p \oplus q) \mid r$  and  $(p \mid r) \oplus (q \mid r)$  converge to the same expression with the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$\begin{array}{c}
1164 \quad ((p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H') \\
((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')
\end{array} \tag{81}$$

1165 **Case (2):**  $(p, H, H') \xrightarrow{x?z} (p', H, H') \quad (r, H, H') \xrightarrow{x!z} (r', H, H')$

1166 The derivations of  $(p \oplus q) \mid r$  are as follows:

(c)

$$\begin{array}{c}
1168 \quad (\mathbf{cpol}_{-\oplus}) \frac{(p, H, H') \xrightarrow{x?z} (p', H, H')}{(p \oplus q, H, H') \xrightarrow{x?z} (p', H, H')} \quad \frac{}{(r, H, H') \xrightarrow{x!z} (r', H, H')} \\
\frac{(|?)}{((p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')}
\end{array}$$

1169 The derivations of  $(p \mid r) \oplus (q \mid r)$  are as follows:

(d)

$$\begin{array}{c}
1170 \quad \frac{(|?) \frac{(p, H, H') \xrightarrow{x?z} (p', H, H') \quad (r, H, H') \xrightarrow{x!z} (r', H, H')}{(p \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')}}{((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')} \\
(\mathbf{cpol}_{-\oplus})
\end{array}$$

1171 As demonstrated in (c) and (d), if  $(p, H, H') \xrightarrow{x!z} (p', H, H')$  and  $(r, H, H') \xrightarrow{x?z} (r', H, H')$  hold then both of the terms  $(p \oplus q) \mid r$  and  $(p \mid r) \oplus (q \mid r)$  converge to the same expression with the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$\begin{array}{c}
1174 \quad ((p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H') \\
((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')
\end{array} \tag{82}$$

1175 **Case (3):**  $(q, H, H') \xrightarrow{x!z} (q', H, H') \quad (r, H, H') \xrightarrow{x?z} (r', H, H')$

1176 The derivations of  $(p \oplus q) \mid r$  are as follows:

1177

(e)

$$\begin{array}{c}
 1178 \quad (\mathbf{cpol}_{\oplus \_}) \frac{(q, H, H') \xrightarrow{x!z} (q', H, H')}{(p \oplus q, H, H') \xrightarrow{x!z} (q', H, H')} \quad \frac{}{(r, H, H') \xrightarrow{x?z} (r', H, H')} \\
 (|!?) \frac{}{(p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H')}
 \end{array}$$

 1179 The derivations of  $(p \mid r) \oplus (q \mid r)$  are as follows:

(f)

$$\begin{array}{c}
 1180 \quad (|!?) \frac{(q, H, H') \xrightarrow{x!z} (q', H, H') \quad (r, H, H') \xrightarrow{x?z} (r', H, H')}{(q \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H')} \\
 (\mathbf{cpol}_{\oplus \_}) \frac{}{((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H')}
 \end{array}$$

1181 As demonstrated in (e) and (f), if  $(q, H, H') \xrightarrow{x!z} (q', H, H')$  and  $(r, H, H') \xrightarrow{x!z} (r', H, H')$   
 1182 hold then both of the terms  $(p \oplus q) \mid r$  and  $(p \mid r) \oplus (q \mid r)$  converge to the same expression  
 1183 with the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$\begin{array}{c}
 1184 \quad ((p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H') \\
 ((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H')
 \end{array} \tag{83}$$

1185 **Case (4):**  $(q, H, H') \xrightarrow{x?z} (q', H, H') \quad (r, H, H') \xrightarrow{x!z} (r', H, H')$

1186

 1187 The derivations of  $(p \oplus q) \mid r$  are as follows:

(g)

$$\begin{array}{c}
 1188 \quad (\mathbf{cpol}_{\oplus \_}) \frac{(q, H, H') \xrightarrow{x?z} (q', H, H')}{(p \oplus q, H, H') \xrightarrow{x?z} (q', H, H')} \quad \frac{}{(r, H, H') \xrightarrow{x!z} (r', H, H')} \\
 (|!?) \frac{}{(p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel r', H, H')}
 \end{array}$$

 1189 The derivations of  $(p \mid r) \oplus (q \mid r)$  are as follows:

(h)

$$\begin{array}{c}
 1190 \quad (|!?) \frac{(q, H, H') \xrightarrow{x?z} (q', H, H') \quad (r, H, H') \xrightarrow{x!z} (r', H, H')}{(q \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H')} \\
 (\mathbf{cpol}_{\oplus \_}) \frac{}{((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H')}
 \end{array}$$

1191 As demonstrated in (g) and (h), if  $(q, H, H') \xrightarrow{x?z} (q', H, H')$  and  $(r, H, H') \xrightarrow{x!z} (r', H, H')$   
 1192 hold then both of the terms  $(p \oplus q) \mid r$  and  $(p \mid r) \oplus (q \mid r)$  converge to the same  
 1193 expression with the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$\begin{array}{c}
 1194 \quad ((p \oplus q) \mid r, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H') \\
 ((p \mid r) \oplus (q \mid r), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel r', H, H')
 \end{array} \tag{84}$$

Therefore, by (81), (82), (83) and (84) it is straightforward to conclude that the following holds:

$$((p \oplus q) \mid r) \sim ((p \mid r) \oplus (q \mid r)) \quad (85)$$

■ Axiom under consideration:

$$p \mid q \equiv q \mid p \quad (A14) \quad (86)$$

for  $p, q \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are the possible transitions that can initially occur in the terms  $p \mid q$  and  $q \mid p$ :

$$\begin{cases} (1) (p, H, H') \xrightarrow{x!z} (p', H, H') & (q, H, H') \xrightarrow{x?z} (q', H, H') \\ (2) (p, H, H') \xrightarrow{x?z} (p', H, H') & (q, H, H') \xrightarrow{x!z} (q', H, H') \end{cases}$$

$$\textbf{Case (1): } (p, H, H') \xrightarrow{x!z} (p', H, H') \quad (q, H, H') \xrightarrow{x?z} (q', H, H')$$

The derivations of  $p \mid q$  are as follows:

$$(a) \quad \frac{(|?) \frac{(p, H, H') \xrightarrow{x!z} (p', H, H') \quad (q, H, H') \xrightarrow{x?z} (q', H, H')}{(p \mid q, H, H') \xrightarrow{\text{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H, H')}}{}$$

The derivations of  $q \mid p$  are as follows:

$$(b) \quad \frac{(|?) \frac{(q, H, H') \xrightarrow{x?z} (q', H, H') \quad (p, H, H') \xrightarrow{x!z} (p', H, H')}{(q \mid p, H, H') \xrightarrow{\text{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel p', H, H')}}{}$$

As demonstrated in (a) and (b), if  $(p, H, H') \xrightarrow{x!z} (p', H, H')$  and  $(q, H, H') \xrightarrow{x?z} (q', H, H')$  hold then both of the terms  $p \mid q$  and  $q \mid p$  are able to perform the  $\text{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$\begin{aligned} (p \mid q, H, H') &\xrightarrow{\text{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H, H') \\ (q \mid p, H, H') &\xrightarrow{\text{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel p', H, H') \end{aligned} \quad (87)$$

Observe that the terms evolve into different expressions and we would now need to check if these terms are bisimilar. According to the axiom (A6), the “ $\parallel$ ” operator is commutative. Hence, the following holds:

$$(p' \parallel q') \sim (q' \parallel p') \quad (88)$$

$$\textbf{Case (2): } (p, H, H') \xrightarrow{x?z} (p', H, H') \quad (q, H, H') \xrightarrow{x!z} (q', H, H')$$

The derivations of  $p \mid q$  are as follows:

$$(c) \quad \frac{(|?) \frac{(p, H, H') \xrightarrow{x?z} (p', H, H') \quad (q, H, H') \xrightarrow{x!z} (q', H, H')}{(p \mid q, H, H') \xrightarrow{\text{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H, H')}}{}$$

1224 The derivations of  $q \mid p$  are as follows:

(d)

$$1225 \quad \frac{(|?) \quad \frac{(q, H, H') \xrightarrow{x!z} (q', H, H') \quad (p, H, H') \xrightarrow{x?z} (p', H, H')}{(q \mid p, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel p', H, H')}}{(q \mid p, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel p', H, H')}$$

1226 As demonstrated in (c) and (d), if  $(p, H, H') \xrightarrow{x!z} (p', H, H')$  and  $(q, H, H') \xrightarrow{x?z} (q', H, H')$  hold then both of the terms  $p \mid q$  and  $q \mid p$  are able to perform the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition:

$$1229 \quad \begin{aligned} (p \mid q, H, H') &\xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p' \parallel q', H, H') \\ (q \mid p, H, H') &\xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (q' \parallel p', H, H') \end{aligned} \quad (89)$$

1230 Observe that the terms evolve into different expressions and we would now need to check if  
1231 these terms are bisimilar. According to the axiom (A6), the “ $\parallel$ ” operator is commutative.  
1232 Hence, the following holds:

$$1233 \quad (p' \parallel q') \sim (q' \parallel p') \quad (90)$$

1234 Therefore, by (87), (88), (89) and (90) it is straightforward to conclude that the following  
1235 holds:

$$1236 \quad (p \mid q) \sim (q \mid p) \quad (91)$$

1237

1238 ■ Axiom under consideration:

$$1239 \quad p \mid q \equiv \perp \text{ [} \textit{owise} \text{]} \quad (A15) \quad (92)$$

1240 for  $p, q \in \text{DyNetKAT}$ . Observe that the  $\text{[} \textit{owise} \text{]}$  condition implies that  $p$  cannot be of  
1241 shape  $x?z; r$  when  $q$  is of shape  $x!z; r'$ , as otherwise the axiom (A12) would become  
1242 applicable (or vice versa due to commutativity of  $\mid$ ). Furthermore, note that if  $p$  or  $q$   
1243 contains operators other than sequential composition ( $;$ ), that is the operators “ $\oplus$ ”, “ $\parallel$ ”  
1244 and “ $\mid$ ”, then the axioms such as (A8), (A10) and (A13) would become applicable and  
1245 hence the  $\text{[} \textit{owise} \text{]}$  condition would not be met. The axiom (A15) can be written explicitly  
1246 as follows:

$$1247 \quad (z; p) \mid q \equiv \perp \quad (93)$$

$$1248 \quad (x?z; p) \mid (x'?z'; q) \equiv \perp \quad (94)$$

$$1249 \quad (x!z; p) \mid (x'?z'; q) \equiv \perp \quad (95)$$

$$1250 \quad (x?z; p) \mid (x'?z'; q) \equiv \perp \text{ if } x \neq x' \text{ or } z \neq z' \quad (96)$$

$$1251 \quad (\mathbf{rcfg}_{x,z}; p) \mid q \equiv \perp \quad (97)$$

1253 for  $z, z' \in \text{NetKAT}^{-\text{dup}}$ . Observe that the term  $\perp$  does not afford any transition and  
1254 none of the terms on the left hand side of the equivalences above afford any transition as  
1255 well. Therefore, the following holds if the  $\text{[} \textit{owise} \text{]}$  condition is met:

$$1256 \quad (p \mid q) \sim \perp \quad (98)$$

1257

1258 ■ Axiom under consideration:

$$1259 \quad \delta_{\mathcal{L}}(\perp) \equiv \perp \quad (\delta_{\perp}) \quad (99)$$

1260 Observe that according to the semantic rules of DyNetKAT, the terms  $\delta_{\mathcal{L}}(\perp)$  and  $\perp$  do  
1261 not afford any transition. Hence, the following trivially holds:

$$1262 \quad (\delta_{\mathcal{L}}(\perp)) \sim \perp \quad (100)$$

1263  
1264 ■ Axiom under consideration:

$$1265 \quad \delta_{\mathcal{L}}(at; p) \equiv at; \delta_{\mathcal{L}}(p) \text{ if } at \notin \mathcal{L} \quad (\delta_{\cdot}) \quad (101)$$

1266 for  $at \in \{\alpha \cdot \pi, x?z, x!z, \mathbf{rcfg}_{x,z}\}$ ,  $z \in \text{NetKAT}^{-\text{dup}}$  and  $p \in \text{DyNetKAT}$ . In the following,  
1267 we make a case analysis on the shape of  $at$  and show that the terms  $\delta_{\mathcal{L}}(at; p)$  and  $at; \delta_{\mathcal{L}}(p)$   
1268 are bisimilar. In our analysis we always assume that the condition  $at \notin \mathcal{L}$  is satisfied, as  
1269 otherwise this axiom is not applicable.

1270 **Case (1):**  $at \triangleq \alpha \cdot \pi$

1271  
1272 Consider an arbitrary but fixed network packet  $\sigma$ , let  $S_{\alpha\pi} \triangleq \llbracket \alpha \cdot \pi \rrbracket(\sigma::\langle \rangle)$ . The derivations  
1273 of  $\delta_{\mathcal{L}}((\alpha \cdot \pi); p)$  are as follows:

$$(a) \quad \text{For all } \sigma' \in S_{\alpha\pi} : \quad (\mathbf{cpol}_{-}^{\vee}) \frac{}{((\alpha \cdot \pi); p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')} \quad (\delta) \frac{}{(\delta_{\mathcal{L}}((\alpha \cdot \pi); p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\delta_{\mathcal{L}}(p), H, \sigma' :: H')}$$

1275 The derivations of  $(\alpha \cdot \pi); \delta_{\mathcal{L}}(p)$  are as follows:

$$(b) \quad \text{For all } \sigma' \in S_{\alpha\pi} : \quad (\mathbf{cpol}_{-}^{\vee}) \frac{}{((\alpha \cdot \pi); \delta_{\mathcal{L}}(p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\delta_{\mathcal{L}}(p), H, \sigma' :: H')}$$

1277 As demonstrated in (a) and (b), both of the terms  $\delta_{\mathcal{L}}((\alpha \cdot \pi); p)$  and  $(\alpha \cdot \pi); \delta_{\mathcal{L}}(p)$  initially  
1278 afford the same set of transitions of shape  $(\sigma, \sigma')$  and they converge to the same expression  
1279 after taking these transitions:

$$1280 \quad \begin{aligned} &(\delta_{\mathcal{L}}((\alpha \cdot \pi); p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\delta_{\mathcal{L}}(p), H, \sigma' :: H') \\ &((\alpha \cdot \pi); \delta_{\mathcal{L}}(p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\delta_{\mathcal{L}}(p), H, \sigma' :: H') \end{aligned} \quad (102)$$

1281 **Case (2):**  $at \triangleq x?z$

1282  
1283 The derivations of  $\delta_{\mathcal{L}}(x?z; p)$  are as follows:

$$(c) \quad \begin{aligned} &(\mathbf{cpol}_{?}) \frac{}{(x?z; p, H, H') \xrightarrow{x?z} (p, H, H')} \\ &(\delta) \frac{}{(\delta_{\mathcal{L}}(x?z; p), H, H') \xrightarrow{x?z} (\delta_{\mathcal{L}}(p), H, H')} \end{aligned}$$

1285 The derivations of  $x?z; \delta_{\mathcal{L}}(p)$  are as follows:

(d)

$$1286 \quad (\mathbf{cpol}_?) \frac{}{(x?z; \delta_{\mathcal{L}}(p), H, H') \xrightarrow{x?z} (\delta_{\mathcal{L}}(p), H, H')}$$

1287 As demonstrated in (c) and (d), both of the terms  $\delta_{\mathcal{L}}(x?z; p)$  and  $x?z; \delta_{\mathcal{L}}(p)$  initially  
 1288 only afford the  $x?z$  transition and they converge to the same expression after taking this  
 1289 transition:

$$1290 \quad \begin{aligned} &(\delta_{\mathcal{L}}(x?z; p), H, H') \xrightarrow{x?z} (\delta_{\mathcal{L}}(p), H, H') \\ &(x?z; \delta_{\mathcal{L}}(p), H, H') \xrightarrow{x?z} (\delta_{\mathcal{L}}(p), H, H') \end{aligned} \quad (103)$$

1291 **Case (3):**  $at \triangleq x!z$

1292

1293 The derivations of  $\delta_{\mathcal{L}}(x!z; p)$  are as follows:

(e)

$$1294 \quad \begin{aligned} &(\mathbf{cpol}_!) \frac{}{(x!z; p, H, H') \xrightarrow{x!z} (p, H, H')} \\ &(\delta) \frac{}{(\delta_{\mathcal{L}}(x!z; p), H, H') \xrightarrow{x!z} (\delta_{\mathcal{L}}(p), H, H')} \end{aligned}$$

1295 The derivations of  $x!z; \delta_{\mathcal{L}}(p)$  are as follows:

(f)

$$1296 \quad (\mathbf{cpol}_!) \frac{}{(x!z; \delta_{\mathcal{L}}(p), H, H') \xrightarrow{x!z} (\delta_{\mathcal{L}}(p), H, H')}$$

1297 As demonstrated in (e) and (f), both of the terms  $\delta_{\mathcal{L}}(x!z; p)$  and  $x!z; \delta_{\mathcal{L}}(p)$  initially  
 1298 only afford the  $x!z$  transition and they converge to the same expression after taking this  
 1299 transition:

$$1300 \quad \begin{aligned} &(\delta_{\mathcal{L}}(x!z; p), H, H') \xrightarrow{x!z} (\delta_{\mathcal{L}}(p), H, H') \\ &(x!z; \delta_{\mathcal{L}}(p), \sigma :: H, H') \xrightarrow{x!z} (\delta_{\mathcal{L}}(p), H, H') \end{aligned} \quad (104)$$

1301 **Case (4):**  $at \triangleq \mathbf{rcfg}_{x,z}$

1302

1303 The derivations of  $\delta_{\mathcal{L}}(\mathbf{rcfg}_{x,z}; p)$  are as follows:

(g)

$$1304 \quad \begin{aligned} &(\mathbf{rcfg}_{\mathbf{x}, \mathbf{z}}) \frac{}{(\mathbf{rcfg}_{x,z}; p, H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (p, H, H')} \\ &(\delta) \frac{}{(\delta_{\mathcal{L}}(\mathbf{rcfg}_{x,z}; p), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (\delta_{\mathcal{L}}(p), H, H')} \end{aligned}$$

1305 The derivations of  $\mathbf{rcfg}_{x,z}; \delta_{\mathcal{L}}(p)$  are as follows:

(h)

$$1306 \quad (\mathbf{rcfg}_{\mathbf{x}, \mathbf{z}}) \frac{}{(\mathbf{rcfg}_{x,z}; \delta_{\mathcal{L}}(p), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (\delta_{\mathcal{L}}(p), H, H')}$$

As demonstrated in (g) and (h), both of the terms  $\delta_{\mathcal{L}}(\mathbf{rcfg}_{x,z}; p)$  and  $\mathbf{rcfg}_{x,z}; \delta_{\mathcal{L}}(p)$  initially only afford the  $\mathbf{rcfg}(\mathbf{x}, \mathbf{z})$  transition and they converge to the same expression after taking this transition:

$$\begin{aligned} & (\delta_{\mathcal{L}}(\mathbf{rcfg}_{x,z}; p), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (\delta_{\mathcal{L}}(p), H, H') \\ & (\mathbf{rcfg}_{x,z}; \delta_{\mathcal{L}}(p), H, H') \xrightarrow{\mathbf{rcfg}(\mathbf{x}, \mathbf{z})} (\delta_{\mathcal{L}}(p), H, H') \end{aligned} \quad (105)$$

Therefore, if  $at \notin \mathcal{L}$ , by (102), (103), (104) and (105) it is straightforward to conclude that the following holds:

$$(\delta_{\mathcal{L}}(at; p)) \sim (at; \delta_{\mathcal{L}}(p)) \quad (106)$$

■ Axiom under consideration:

$$\delta_{\mathcal{L}}(at; p) \equiv \perp \text{ if } at \in \mathcal{L} \quad (\delta_{\perp}^{\perp}) \quad (107)$$

Observe that according to the semantic rules of DyNetKAT, the term  $\perp$  do not afford any transition. Furthermore, if the condition  $at \in \mathcal{L}$  is satisfied, then the term  $\delta_{\mathcal{L}}(at; p)$  also does not afford any transition. Therefore, if  $at \in \mathcal{L}$ , the following trivially holds:

$$\delta_{\mathcal{L}}(at; p) \sim \perp \quad (108)$$

■ Axiom under consideration:

$$\delta_{\mathcal{L}}(p \oplus q) \equiv \delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q) \quad (\delta_{\oplus}) \quad (109)$$

for  $p, q \in \text{DyNetKAT}$ . According to the semantic rules of DyNetKAT, the following are the possible transitions that can initially occur in the terms  $\delta_{\mathcal{L}}(p \oplus q)$  and  $\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q)$ :

$$\begin{cases} (1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\ (2) (q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \end{cases}$$

$$\gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$$

$$\textbf{Case (1): } (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$$

The derivations of  $\delta_{\mathcal{L}}(p \oplus q)$  are as follows:

(a)

$$\begin{aligned} & (\mathbf{cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)} \\ & (\delta) \frac{}{(\delta_{\mathcal{L}}(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(p'), H_1, H'_1)} \end{aligned}$$

The derivations of  $\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q)$  are as follows:

(b)

$$\begin{aligned} & (\delta) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(\delta_{\mathcal{L}}(p), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(p'), H_1, H'_1)} \\ & (\mathbf{cpol}_{-\oplus}) \frac{}{(\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(p'), H_1, H'_1)} \end{aligned}$$

1335 As demonstrated in (a) and (b), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then both of the  
 1336 terms  $\delta_{\mathcal{L}}(p \oplus q)$  and  $\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q)$  converge to the same expression with the  $\gamma$  transition:

$$1337 \quad \begin{aligned} &(\delta_{\mathcal{L}}(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(p'), H_1, H'_1) \\ &(\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(p'), H_1, H'_1) \end{aligned} \quad (110)$$

1338 **Case (2):**  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$

1339  
 1340 The derivations of  $\delta_{\mathcal{L}}(p \oplus q)$  are as follows:

$$1341 \quad \begin{aligned} &(c) \\ &\frac{(\mathbf{cpol}_{\oplus}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}}{(\delta) \frac{(\delta_{\mathcal{L}}(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(q'), H_1, H'_1)}} \end{aligned}$$

1342 The derivations of  $\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q)$  are as follows:

$$1343 \quad \begin{aligned} &(d) \\ &\frac{(\delta) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(\delta_{\mathcal{L}}(q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(q'), H_1, H'_1)}}{(\mathbf{cpol}_{\oplus}) \frac{(\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(q'), H_1, H'_1)}} \end{aligned}$$

1344 As demonstrated in (c) and (d), if  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$  holds then both of the  
 1345 terms  $\delta_{\mathcal{L}}(p \oplus q)$  and  $\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q)$  converge to the same expression with the  $\gamma$  transition:

$$1346 \quad \begin{aligned} &(\delta_{\mathcal{L}}(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(q'), H_1, H'_1) \\ &(\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q), H_0, H'_0) \xrightarrow{\gamma} (\delta_{\mathcal{L}}(q'), H_1, H'_1) \end{aligned} \quad (111)$$

1347 Therefore, by (110), and (111) it is straightforward to conclude that the following holds:

$$1348 \quad (\delta_{\mathcal{L}}(p \oplus q)) \sim (\delta_{\mathcal{L}}(p) \oplus \delta_{\mathcal{L}}(q)) \quad (112)$$

1349  
 1350 ■ Axiom under consideration:

$$1351 \quad \pi_0(p) \equiv \perp \quad (\Pi_0) \quad (113)$$

1352 for  $p \in \text{DyNetKAT}$ . Observe that according to the semantic rules of DyNetKAT, the  
 1353 terms  $\pi_0(p)$  and  $\perp$  do not afford any transition. Hence, the following trivially holds:

$$1354 \quad \pi_0(p) \sim \perp \quad (114)$$

1355  
 1356 ■ Axiom under consideration:

$$1357 \quad \pi_n(\perp) \equiv \perp \quad (\Pi_{\perp}) \quad (115)$$

1358 for  $n \in \mathbb{N}$ . Observe that according to the semantic rules of DyNetKAT, the terms  $\pi_0(\perp)$   
 1359 and  $\perp$  do not afford any transition. Hence, the following trivially holds:

$$1360 \quad \pi_n(\perp) \sim \perp \quad (116)$$

1361

1362 ■ Axiom under consideration:

$$1363 \quad \pi_{n+1}(at; p) \equiv at; \pi_n(p) \quad (\Pi;) \quad (117)$$

1364 for  $at \in \{\alpha \cdot \pi, x?z, x!z, \mathbf{rcfg}_{x,z}\}$ ,  $z \in \text{NetKAT}^{-\text{dup}}$ ,  $n \in \mathbb{N}$  and  $p \in \text{DyNetKAT}$ . In the  
 1365 following, we make a case analysis on the shape of  $at$  and show that the terms  $\pi_{n+1}(at; p)$   
 1366 and  $at; \pi_n(p)$  are bisimilar.

1367 **Case (1):**  $at \triangleq \alpha \cdot \pi$

1368 Consider an arbitrary but fixed network packet  $\sigma$ , let  $S_{\alpha\pi} \triangleq \llbracket \alpha \cdot \pi \rrbracket(\sigma; \langle \rangle)$ . The derivations  
 1369 of  $\pi_{n+1}((\alpha \cdot \pi); p)$  are as follows:

(a)

$$1371 \quad \text{For all } \sigma' \in S_{\alpha\pi} : \quad (\mathbf{cpol}_{-}^{\vee};) \frac{\frac{((\alpha \cdot \pi); p, \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (p, H, \sigma' :: H')}{(\pi)}}{(\pi_{n+1}((\alpha \cdot \pi); p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\pi_n(p), H, \sigma' :: H)}$$

1372 The derivations of  $(\alpha \cdot \pi); \pi_n(p)$  are as follows:

(b)

$$1373 \quad \text{For all } \sigma' \in S_{\alpha\pi} : \quad (\mathbf{cpol}_{-}^{\vee};) \frac{((\alpha \cdot \pi); \pi_n(p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\pi_n(p), H, \sigma' :: H')}{((\alpha \cdot \pi); \pi_n(p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\pi_n(p), H, \sigma' :: H')}$$

1374 As demonstrated in (a) and (b), both of the terms  $\pi_{n+1}((\alpha \cdot \pi); p)$  and  $(\alpha \cdot \pi); \pi_n(p)$   
 1375 initially only afford the same set of transitions of shape  $(\sigma, \sigma')$  and they converge to the  
 1376 same expression after taking these transitions:

$$1377 \quad \begin{aligned} & (\pi_{n+1}((\alpha \cdot \pi); p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\pi_n(p), H, \sigma' :: H') \\ & ((\alpha \cdot \pi); \pi_n(p), \sigma :: H, H') \xrightarrow{(\sigma, \sigma')} (\pi_n(p), H, \sigma' :: H') \end{aligned} \quad (118)$$

1378 **Case (2):**  $at \triangleq x?z$

1379

1380 The derivations of  $\pi_{n+1}(x?z; p)$  are as follows:

(c)

$$1381 \quad (\mathbf{cpol}_{?}) \frac{\frac{(x?z; p, \sigma :: H, H') \xrightarrow{x?z} (p, H, H')}{(\pi)}}{(\pi_{n+1}(x?z; p), H, H') \xrightarrow{x?z} (\pi_n(p), H, H')}$$

1382 The derivations of  $x?z; \delta_{\mathcal{L}}(p)$  are as follows:

(d)

$$1383 \quad (\mathbf{cpol}_{?}) \frac{(x?z; \pi_n(p), H, H') \xrightarrow{x?z} (\pi_n(p), H, H')}{(x?z; \pi_n(p), H, H') \xrightarrow{x?z} (\pi_n(p), H, H')}$$

1384 As demonstrated in (c) and (d), both of the terms  $\pi_{n+1}(x?z; p)$  and  $x?z; \pi_n(p)$  initially  
 1385 only afford the  $x?z$  transition and they converge to the same expression after taking this  
 1386 transition:

$$1387 \quad \begin{aligned} & (\pi_{n+1}(x?z; p), H, H') \xrightarrow{x?z} (\pi_n(p), H, H') \\ & (x?z; \pi_n(p), H, H') \xrightarrow{x?z} (\pi_n(p), H, H') \end{aligned} \quad (119)$$

1388 **Case (3):**  $at \triangleq x!z$

1389

1390 The derivations of  $\pi_{n+1}(x!z; p)$  are as follows:

(e)

$$1391 \quad \frac{(\mathbf{cpol}) \frac{}{(x!z; p, H, H') \xrightarrow{x!z} (p, H, H')}}{(\pi) \frac{}{(\pi_{n+1}(x!z; p), H, H') \xrightarrow{x!z} (\pi_n(p), H, H')}}}$$

1392 The derivations of  $x!z; \pi_n(p)$  are as follows:

(f)

$$1393 \quad (\mathbf{cpol}) \frac{}{(x!z; \pi_n(p), H, H') \xrightarrow{x!z} (\pi_n(p), H, H')}$$

1394 As demonstrated in (e) and (f), both of the terms  $\pi_{n+1}(x!z; p)$  and  $x!z; \pi_n(p)$  initially  
 1395 only afford the  $x!z$  transition and they converge to the same expression after taking this  
 1396 transition:

$$1397 \quad \begin{aligned} &(\pi_{n+1}(x!z; p), H, H') \xrightarrow{x!z} (\pi_n(p), H, H') \\ &(x!z; \pi_n(p), H, H') \xrightarrow{x!z} (\pi_n(p), H, H') \end{aligned} \quad (120)$$

1398 **Case (4):**  $at \triangleq \mathbf{rcfg}_{x,z}$

1399

1400 The derivations of  $\pi_{n+1}(\mathbf{rcfg}_{x,z}; p)$  are as follows:

(g)

$$1401 \quad \frac{(\mathbf{rcfg}_{x,z}) \frac{}{(\mathbf{rcfg}_{x,z}; p, H, H') \xrightarrow{\mathbf{rcfg}(x,z)} (p, H, H')}}{(\delta) \frac{}{(\pi_{n+1}(\mathbf{rcfg}_{x,z}; p), H, H') \xrightarrow{\mathbf{rcfg}(x,z)} (\pi_n(p), H, H')}}}$$

1402 The derivations of  $\mathbf{rcfg}_{x,z}; \pi_n(p)$  are as follows:

(h)

$$1403 \quad (\mathbf{rcfg}_{x,z}) \frac{}{(\mathbf{rcfg}_{x,z}; \pi_n(p), H, H') \xrightarrow{\mathbf{rcfg}(x,z)} (\pi_n(p), H, H')}$$

1404 As demonstrated in (g) and (h), both of the terms  $\pi_{n+1}(\mathbf{rcfg}_{x,z}; p)$  and  $\mathbf{rcfg}_{x,z}; \pi_n(p)$   
 1405 initially only afford the  $\mathbf{rcfg}(x, z)$  transition and they converge to the same expression  
 1406 after taking this transition:

$$1407 \quad \begin{aligned} &(\pi_{n+1}(\mathbf{rcfg}_{x,z}; p), H, H') \xrightarrow{\mathbf{rcfg}(x,z)} (\pi_n(p), H, H') \\ &(\mathbf{rcfg}_{x,z}; \pi_n(p), H, H') \xrightarrow{\mathbf{rcfg}(x,z)} (\pi_n(p), H, H') \end{aligned} \quad (121)$$

1408 Therefore, if  $at \notin \mathcal{L}$ , by (118), (119), (120) and (121) it is straightforward to conclude  
 1409 that the following holds:

$$1410 \quad (\pi_{n+1}(at; p)) \sim (at; \pi_n(p)) \quad (122)$$

1411

1412 ■ Axiom under consideration:

$$1413 \quad \pi_n(p \oplus q) \equiv \pi_n(p) \oplus \pi_n(q) \quad (\pi \oplus) \quad (123)$$

1414 for  $p, q \in \text{DyNetKAT}$ . Observe that if  $n = 0$ , then both of the terms do not afford any  
 1415 transition and bisimilarity holds trivially. If  $n > 0$ , according to the semantic rules of  
 1416 DyNetKAT, the following are the possible transitions that can initially occur in the terms  
 1417  $\pi_n(p \oplus q)$  and  $\pi_n(p) \oplus \pi_n(q)$ :

$$1418 \quad \begin{cases} (1) (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1) \\ (2) (q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1) \end{cases}$$

$$1420 \quad \gamma ::= (\sigma, \sigma') \mid x!z \mid x?z \mid \mathbf{rcfg}(\mathbf{x}, \mathbf{z})$$

$$1421 \quad \mathbf{Case (1):} (p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$$

1422 The derivations of  $\pi_n(p \oplus q)$  are as follows:  
 1423

(a)

$$1424 \quad \frac{(\mathbf{cpol}_{-\oplus}) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}}{(\pi) \frac{(\pi_n(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(p'), H_1, H'_1)}}$$

1425 The derivations of  $\pi_n(p) \oplus \pi_n(q)$  are as follows:

(b)

$$1426 \quad \frac{(\pi) \frac{(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)}{(\pi_n(p), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(p'), H_1, H'_1)}}{(\mathbf{cpol}_{-\oplus}) \frac{(\pi_n(p) \oplus \pi_n(q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(p'), H_1, H'_1)}}$$

1427 As demonstrated in (a) and (b), if  $(p, H_0, H'_0) \xrightarrow{\gamma} (p', H_1, H'_1)$  holds then both of the  
 1428 terms  $\pi_n(p \oplus q)$  and  $\pi_n(p) \oplus \pi_n(q)$  converge to the same expression with the  $\gamma$  transition:  
 1429

$$1430 \quad \begin{aligned} &(\pi_n(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(p'), H_1, H'_1) \\ &(\pi_n(p) \oplus \pi_n(q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(p'), H_1, H'_1) \end{aligned} \quad (124)$$

$$1431 \quad \mathbf{Case (2):} (q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$$

1432 The derivations of  $\pi_n(p \oplus q)$  are as follows:  
 1433

(c)

$$1434 \quad \frac{(\mathbf{cpol}_{\oplus-}) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(p \oplus q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}}{(\pi) \frac{(\pi_n(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(q'), H_1, H'_1)}}$$

1435 The derivations of  $\pi_n(p) \oplus \pi_n(q)$  are as follows:

(d)

$$\begin{array}{c}
 1436 \quad (\pi) \frac{(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)}{(\pi_n(q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(q'), H_1, H'_1)} \\
 (\mathbf{cpol}_{\oplus-}) \frac{}{(\pi_n(p) \oplus \pi_n(q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(q'), H_1, H'_1)}
 \end{array}$$

1437 As demonstrated in (c) and (d), if  $(q, H_0, H'_0) \xrightarrow{\gamma} (q', H_1, H'_1)$  holds then both of the  
 1438 terms  $\pi_n(p \oplus q)$  and  $\pi_n(p) \oplus \pi_n(q)$  converge to the same expression with the  $\gamma$  transition:  
 1439

$$\begin{array}{c}
 1440 \quad (\pi_n(p \oplus q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(q'), H_1, H'_1) \\
 (\pi_n(p) \oplus \pi_n(q), H_0, H'_0) \xrightarrow{\gamma} (\pi_{n-1}(q'), H_1, H'_1)
 \end{array} \tag{125}$$

1441 Therefore, by (124) and (125) it is straightforward to conclude that the following holds:

$$1442 \quad (\pi_n(p \oplus q)) \sim (\pi_n(p) \oplus \pi_n(q)) \tag{126}$$
